1.1

$$A_s = 6.0 \text{ in}^2$$

$$f_y = 40,000 \text{ psi}$$

$$E_s = 29,000,000 \text{ psi}$$

$$n = \frac{29,000,000}{3,600,000} = 8$$

$$A_g = 16 \times 20 = 320 \text{ in}^2$$

$$A_c = 320 - 6 = 314 \text{ in}^2$$

$$f_c' = 4,000 \text{ psi}$$

$$E_c = 3,600,000$$

a)  $f_c = 1200 \text{ psi}$ ,  $f_y = 40,000 \text{ psi}$

$$P = 1200(314 + 8 \times 6) = 434,000 \text{ lbs}$$

$$P_s = 1200(8 \times 6) = 57,600 \text{ lbs}$$

$$P_s = 13.3\% \text{ of } P$$

b)  $\epsilon_y = \frac{40,000}{29,000,000} = 0.00140$

for slow loading  $f_c = 3000 \text{ psi}$

$$P = 3000(314) + 40,000(6) = 1,182,000 \text{ lbs}$$

$$P_s = 40,000(6) = 240,000 \text{ lb}$$

$$= 20.3\% P$$

c)  $f_c = 3400 \text{ psi}$

$$P_u = 3400(314) + 40,000(6) = 1,308,000 \text{ lb}$$

$$P_s = 240,000 \text{ lb} \quad (18.3\% P_u)$$

a)  $f_y = 60,000 \text{ psi}$   
Same

$$\epsilon_y = \frac{60,000}{29,000} = 0.00207$$

$$f_c = 3300 \text{ psi}$$

$$P = 3300(314) + 60,000(6) = 1,396,000 \text{ lbs}$$

$$P_s = 60,000(6) = 360,000 \text{ lb}$$

$$= 25.6\% P$$

$$P_u = 3400(314) + 60,000(6) = 1,428,000 \text{ lb}$$

$$P_s = 360,000 \text{ lb} \quad (25.2\% P_u)$$

Comments:

1. There is no difference in performance at  $f_c = 1200 \text{ psi}$
2. As the strain increases, the steel with  $f_y = 60,000 \text{ psi}$  contributes more to the total load and the column has a higher total load.
3. For the same cost,  $f_y = 60,000 \text{ psi}$  provides a 9% increase in capacity.

1.2

$$A_s = 8(1.56) = 12.48 \text{ in}^2$$

$$A_g = 320 \text{ in}^2 \quad A_c = 307.5 \text{ in}^2$$

$$n = 8 \quad E_s = 29,000,000 \text{ psi}$$

$$E_c = 3,600,000 \text{ psi}$$

$$f_y = 40,000 \text{ psi}$$

$$f_y = 60,000 \text{ psi}$$

a)

$$P = 1200(307.5 + 8(12.48)) =$$

$$= 489,000 \text{ lb}$$

$$P_s = 1200(8)(12.48) = 120,000 \text{ lb}$$

$$(24.5\% P)$$

• Same as  $f_y = 40,000$

b)

$$e_y = 0.00140, \quad f_c = 3000 \text{ psi}$$

$$P = 3000(307.5) + 40,000(12.48)$$

$$= 1,424,000 \text{ lb}$$

$$P_s = 40,000(12.48) = 500,000 \text{ lb}$$

$$(35.1\% \text{ of } P)$$

$$e_y = 0.00207 \quad f_c = 3300 \text{ psi}$$

$$P = 3300(307.5) + 60,000(12.48)$$

$$= 1,766,000 \text{ lb}$$

$$P_s = 60,000(12.48) = 750,000$$

$$(42.5\% \text{ of } P)$$

c)

$$f_c = 3400 \text{ psi} \text{ both cases}$$

$$P_0 = 3400(307.5) + 40,000(12.48)$$

$$= 1,547,000 \text{ lb}$$

$$P_s = 500,000 \text{ lb}$$

$$(32.3\% \text{ of } P_0)$$

$$P_0 = 3400(307.5) + 60,000(12.48)$$

$$= 1,797,000 \text{ lb}$$

$$P_s = 750,000 \text{ lb}$$

$$(41.7\% \text{ of } P_0)$$

Comments

1. There is no strength difference at  $f_c = 1200 \text{ psi}$

2. There is a 16% strength increase at ultimate using  $f_y = 60,000 \text{ psi}$ . This occurs at virtually no cost increase

3. The higher steel ratio produces a stronger column - compare to prob. 1.1

1.3

$A_s = 10.12 \text{ in}^2$   
 $A_c = 474 \text{ in}^2$   
 $f_y = 60000 \text{ psi}$   
 $f'_c = 4000 \text{ psi}$

$\epsilon_c = \epsilon_s$	$f_c$ (psi)	$P_c$ (kips)	$f_s$ (psi)	$P_s$ (kips)	$P_{total}$ (kips)	$P_c/P_{total}$	$P_s/P_{total}$
0	0	0	0	0	0	85.0%	15.0%

0.003	3400	1611.6	60000	607.2	2218.8	72.6%	27.4%

1.4 A 20 x 24 in. column is made of the same concrete as Examples 1.1 and 1.2 but reinforced with six No. 11 (No. 36) bars with  $f_y = 60$  ksi. For this column section, determine (a) the axial load the section will carry at a concrete stress of 1400 psi, (b) the load on the section when the steel begins to yield, (c) the maximum load if the section is loaded slowly and (d) the maximum load if the section is loaded rapidly. The area of one No. 11 (No. 36) bar is  $1.56 \text{ in}^2$ . Determine the percent of the load carried by the steel and the concrete for each combination.

#### Reinforcement Areas

##### Given Properties

$$f_c := 4000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad f_c := 1400 \text{ psi} \quad n := 8 \quad E_s := 29000000 \text{ psi}$$

##### Column Properties

$$b := 20 \text{ in} \quad h := 24 \text{ in} \quad A_{st} := 6 \cdot A_{s11} = 9.36 \text{ in}^2 \quad \text{The total area of steel } A_{st} \text{ is six no. 11 bars}$$

**Part (a)** Compute the axial capacity of the section loaded below the elastic limit.

**Solution:** The axial capacity is based on the gross area of the column plus the effective area of the steel. Since we count the holes where the steel is removed, the additional effective area of the steel is  $(n-1)A_{st}$ .

$$A_g := b \cdot h \quad A_g = 480 \text{ in}^2 \quad A_{st} = 9.36 \text{ in}^2 \quad \text{Reinforcement ratio} = \frac{A_{st}}{A_g} = 0.0195$$

$$P := f_c [A_g + (n-1) \cdot A_{st}] \quad P = 764 \text{ kip}$$

$$P_c := f_c (A_g - A_{st}) \quad P_c = 659 \text{ kip}$$

$$P_s := f_c \cdot n \cdot A_{st} \quad P_s = 105 \text{ kip} \quad 100 \cdot \frac{P_c}{P} = 86.3 \quad 100 \cdot \frac{P_s}{P} = 13.7$$

**Part (b):** Compute the capacity of the column when the steel begins to yield  $\epsilon := 0.002069$  or 2/10 of one percent

Examining Figure 1.16, we are **beyond the elastic portion of the concrete** stress strain curve, but we are at the elastic limit of the steel.

$$f_s := \epsilon \cdot E_s \quad f_s = 60001 \text{ psi}$$

$$\text{From Figure 1.16} \quad f_c := 3100 \text{ psi} \quad \text{for slow loading}$$

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1.

$$A_c := A_g - A_{st}$$

$$P := f_c \cdot A_c + f_s \cdot A_{st} \quad P = 2021 \text{ kip}$$

$$P_c := f_c \cdot A_c \quad P_c = 1459 \text{ kip}$$

$$P_s := f_s \cdot A_{st} \quad P_s = 562 \text{ kip} \quad 100 \cdot \frac{P_c}{P} = 72.2 \quad 100 \cdot \frac{P_s}{P} = 27.8$$

**Part (c):** Compute the maximum load capacity of the section

Examining Figure 1.16, we are **beyond the elastic portion of the concrete** stress strain curve, but we are in the plastic range of the steel.

$$f_s := f_y$$

$$f_s = 60000 \text{ psi}$$

From Figure 1.16

$$f_c := 3400 \text{ psi} \quad \text{for slow loading}$$

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1.

$$A_c := A_g - A_{st}$$

$$P := f_c \cdot A_c + f_s \cdot A_{st} \quad P = 2162 \text{ kip}$$

$$P_c := f_c \cdot A_c \quad P_c = 1600 \text{ kip}$$

$$P_s := f_s \cdot A_{st} \quad P_s = 562 \text{ kip} \quad 100 \cdot \frac{P_c}{P} = 74.0 \quad 100 \cdot \frac{P_s}{P} = 26.0$$

If we reexamine the problem with a fast loading as would occur in a building, then the concrete stress would be

$$f_c := 4000 \text{ psi}$$

$$P := f_c \cdot A_c + f_s \cdot A_{st} \quad P = 2444 \text{ kip}$$

$$P_c := f_c \cdot A_c \quad P_c = 1883 \text{ kip} \quad 100 \cdot \frac{P_c}{P} = 77.0$$

$$P_s := f_s \cdot A_{st} \quad P_s = 562 \text{ kip} \quad 100 \cdot \frac{P_s}{P} = 23.0$$

#### Comments

1. As the concrete becomes non-linear, the steel picks up more load, but after the steel yields, the load goes to the concrete.
2. The slow loading is approximately 88% of the fast load scenario

1.5 A 24 in. diameter column is made of the same concrete as Examples 1.1 and 1.2. The area of reinforcement equals 2.1 percent of the gross cross section (i.e.,  $A_s = 0.021A_g$ ) and  $f_y = 60$  ksi. For this column section, determine (a) the axial load the section will carry at a concrete stress of 1200 psi, (b) the load on the section when the steel begins to yield, (c) the maximum load if the section is loaded slowly, (d) the maximum load if the section is loaded rapidly and (e) the maximum load the reinforcement in the column is raised to 6.5 percent and the column is loaded slowly. Comment on your answer, especially the percent of the load carried by the steel and the concrete for each combination.

### Given Properties

$$f_c := 4000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad f_c := 1200 \text{ psi} \quad n := 8 \quad E_s := 29000000 \text{ psi}$$

### Column Properties

$$d := 24 \text{ in} \quad A_g := \pi \frac{d^2}{4} \quad \rho := 0.021 \quad \rho \text{ is the reinforcement ratio or the fraction of the section that is steel}$$

$$A_{st} := \rho A_g \quad \text{The total area of steel } A_{st} \text{ is } A_{st} = 9.5 \text{ in}^2$$

**Part (a)** Compute the axial capacity of the section loaded below the elastic limit.

**Solution:** The axial capacity is based on the gross area of the column plus the effective area of the steel. Since we count the holes where the steel is removed, the additional effective area of the steel is  $(n-1)A_{st}$ .

$$\begin{aligned} A_c &:= A_g - A_{st} & A_g &= 452 \text{ in}^2 & A_{st} &= 9.50 \text{ in}^2 & A_c &= 443 \text{ in}^2 \\ P &:= f_c [A_g + (n-1)A_{st}] & P &= 623 \text{ kip} & & & \text{Concrete and steel contribution} \\ P_c &:= f_c (A_g - A_{st}) & P_c &= 531 \text{ kip} & & & 100 \cdot \frac{P_c}{P} = 85.4 \\ P_s &:= f_c n A_{st} & P_s &= 91 \text{ kip} & & & 100 \cdot \frac{P_s}{P} = 14.6 \end{aligned}$$

**Part (b):** Compute the capacity of the column when the steel begins to yield  $\epsilon_y := \frac{f_y}{E_s}$

$$\epsilon_y = 0.00207 \quad \text{or } 2/10 \text{ of one percent}$$

Examining Figure 1.16, we are **beyond the elastic portion of the concrete stress strain curve**, but we are at the elastic limit of the steel.

$$f_s := \epsilon_y E_s \quad f_s = 60000 \text{ psi}$$

From Figure 1.16  $f_c := 3100 \text{ psi}$  for slow loading

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1.

$$\begin{aligned} P &:= f_c A_c + f_s A_{st} & P &= 1943 \text{ kip} \\ P_c &:= f_c A_c & P_c &= 1373 \text{ kip} & 100 \cdot \frac{P_c}{P} &= 27.4 \\ P_s &:= f_s A_{st} & P_s &= 570 \text{ kip} & 100 \cdot \frac{P_s}{P} &= 29.3 \end{aligned}$$

**Part (c):** Compute the maximum load capacity of the section if loaded slowly

Examining Figure 1.16, we are **beyond the elastic portion of the concrete stress strain curve**

and we are in the plastic range of the steel.

$$f_s := f_y$$

$$f_s = 60000 \text{ psi}$$

From Figure 1.16

$$f_c := 3400 \text{ psi} \quad \text{for slow loading}$$

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1:

$$P := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 2076 \text{ kip}$$

$$P_c := f_c \cdot A_c$$

$$P_c = 1506 \text{ kip}$$

$$100 \cdot \frac{P_c}{P} = 72.5$$

$$P_s := f_s \cdot A_{st}$$

$$P_s = 570 \text{ kip}$$

$$100 \cdot \frac{P_s}{P} = 27.5$$

**Part (d):** If we reexamine the problem with a fast loading as would occur in a building, then the concrete stress would be

$$f_c := 4000 \text{ psi}$$

$$P := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 2342 \text{ kip}$$

$$P_c := f_c \cdot A_c$$

$$P_c = 1772 \text{ kip}$$

$$100 \cdot \frac{P_c}{P} = 75.7$$

$$100 \cdot \frac{P_s}{P} = 24.3$$

$$P_s := f_s \cdot A_{st}$$

$$P_s = 570 \text{ kip}$$

**Part (e):** Determine the capacity for a slow loaded column with the steel changed to 6.5%

$$A_{st} := 0.065 \cdot A_g$$

$$A_{st} = 29.4 \text{ in}^2$$

$$f_s := f_y$$

$$f_s = 60000 \text{ psi}$$

From Figure 1.16

$$f_c := 3400 \text{ psi} \quad \text{for slow loading}$$

$$P := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 3270 \text{ kip}$$

$$P_c := f_c \cdot A_c$$

$$P_c = 1506 \text{ kip}$$

$$100 \cdot \frac{P_c}{P} = 46.0$$

$$P_s := f_s \cdot A_{st}$$

$$P_s = 1764 \text{ kip}$$

$$100 \cdot \frac{P_s}{P} = 54.0$$

### Comments

1. As the concrete becomes non-linear, the steel picks up more load, but after the steel yields, the load goes to the concrete.
2. The slow loading is approximately 88% of the fast load scenario - This is slightly higher than the 0.85 given in eq. 1.8.

1.5 A 24 in. diameter column is made of the same concrete as Examples 1.1 and 1.2. The area of reinforcement equals 2.1 percent of the gross cross section (i.e.,  $A_s = 0.021A_g$ ) and  $f_y = 60$  ksi. For this column section, determine (a) the axial load the section will carry at a concrete stress of 1200 psi, (b) the load on the section when the steel begins to yield, (c) the maximum load if the section is loaded slowly, (d) the maximum load if the section is loaded rapidly and (e) the maximum load the reinforcement in the column is raised to 6.5 percent and the column is loaded slowly. Comment on your answer, especially the percent of the load carried by the steel and the concrete for each combination.

### Given Properties

$$f_c := 4000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad f_c := 1200 \text{ psi} \quad n := 8 \quad E_s := 29000000 \text{ psi}$$

### Column Properties

$$d := 24 \text{ in} \quad A_g := \pi \frac{d^2}{4} \quad \rho := 0.021 \quad \rho \text{ is the reinforcement ratio or the fraction of the section that is steel}$$

$$A_{st} := \rho A_g \quad \text{The total area of steel } A_{st} \text{ is } A_{st} = 9.5 \text{ in}^2$$

**Part (a)** Compute the axial capacity of the section loaded below the elastic limit.

**Solution:** The axial capacity is based on the gross area of the column plus the effective area of the steel. Since we count the holes where the steel is removed, the additional effective area of the steel is  $(n-1)A_{st}$ .

$$A_c := A_g - A_{st}$$

$$A_g = 452 \text{ in}^2 \quad A_{st} = 9.50 \text{ in}^2 \quad A_c = 443 \text{ in}^2$$

$$P := f_c [A_g + (n-1)A_{st}]$$

$$P = 623 \text{ kip} \quad \text{Concrete and steel contribution}$$

$$P_c := f_c (A_g - A_{st})$$

$$P_c = 531 \text{ kip} \quad 100 \cdot \frac{P_c}{P} = 85.4$$

$$P_s := f_y n A_{st}$$

$$P_s = 91 \text{ kip} \quad 100 \cdot \frac{P_s}{P} = 14.6$$

**Part (b):** Compute the capacity of the column when the steel begins to yield  $\epsilon_y := \frac{f_y}{E_s}$

$$\epsilon_y = 0.00207 \quad \text{or } 2/10 \text{ of one percent}$$

Examining Figure 1.16, we are **beyond the elastic portion of the concrete stress strain curve**, but we are at the elastic limit of the steel.

$$f_s := \epsilon_y E_s$$

$$f_s = 60000 \text{ psi}$$

From Figure 1.16

$$f_{s,slow} := 3100 \text{ psi} \quad \text{for slow loading}$$

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1.

$$P_{max} := f_c A_c + f_s A_{st}$$

$$P = 1943 \text{ kip}$$

$$100 \cdot \frac{P_c}{P} = 27.4$$

$$P_{c,slow} := f_c A_c$$

$$P_c = 1373 \text{ kip}$$

$$100 \cdot \frac{P_s}{P} = 29.3$$

$$P_{s,slow} := f_{s,slow} A_{st}$$

$$P_s = 570 \text{ kip}$$

**Part (c):** Compute the maximum load capacity of the section if loaded slowly

Examining Figure 1.16, we are **beyond the elastic portion of the concrete stress strain curve**

and we are in the plastic range of the steel.

$$f_{\max} := f_y$$

$$f_s = 60000 \cdot \text{psi}$$

From Figure 1.16

$$f_{\max} := 3400 \text{ psi} \quad \text{for slow loading}$$

Since the problem is nonlinear, we must break out the concrete and steel areas. We can no longer use the elastic equation from 1.1.

$$P_{\max} := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 2076 \cdot \text{kip}$$

$$P_{\max} := f_c \cdot A_c$$

$$P_c = 1506 \cdot \text{kip}$$

$$100 \cdot \frac{P_c}{P} = 72.5$$

$$P_{\max} := f_s \cdot A_{st}$$

$$P_s = 570 \cdot \text{kip}$$

$$100 \cdot \frac{P_s}{P} = 27.5$$

**Part (d):** If we reexamine the problem with a fast loading as would occur in a building, then the concrete stress would be

$$f_{\max} := 4000 \text{ psi}$$

$$P_{\max} := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 2342 \cdot \text{kip}$$

$$P_{\max} := f_c \cdot A_c$$

$$P_c = 1772 \cdot \text{kip}$$

$$100 \cdot \frac{P_c}{P} = 75.7 \quad 100 \cdot \frac{P_s}{P} = 24.3$$

$$P_{\max} := f_s \cdot A_{st}$$

$$P_s = 570 \cdot \text{kip}$$

**Part (e):** Determine the capacity for a slow loaded column with the steel changed to 6.5%

$$A_{\max} := 0.065 \cdot A_g$$

$$A_{st} = 29.4 \text{ in}^2$$

$$f_{\max} := f_y$$

$$f_s = 60000 \cdot \text{psi}$$

From Figure 1.16

$$f_{\max} := 3400 \text{ psi} \quad \text{for slow loading}$$

$$P_{\max} := f_c \cdot A_c + f_s \cdot A_{st}$$

$$P = 3270 \cdot \text{kip}$$

$$P_{\max} := f_c \cdot A_c$$

$$P_c = 1506 \cdot \text{kip}$$

$$100 \cdot \frac{P_c}{P} = 46.0$$

$$P_{\max} := f_s \cdot A_{st}$$

$$P_s = 1764 \cdot \text{kip}$$

$$100 \cdot \frac{P_s}{P} = 54.0$$

### Comments

1. As the concrete becomes non-linear, the steel picks up more load, but after the steel yields, the load goes to the concrete.
2. The slow loading is approximately 88% of the fast load scenario - This is slightly higher than the 0.85 given in eq. 1.8.

2.1

$$f'_c = 6000 \text{ psi}$$

(a) No prior results

$$f'_{cr} = f'_c + 0.1 f'_c + 700 \text{ psi} = 6000 + 0.1 \times 6000 + 700 = 7300 \text{ psi}$$

(b) 20 prior tests for concrete with  $f'_c$  within

1000 psi of  $f'_c$  for project.  $S_s = 580 \text{ psi}$  -

From Table 1.1,  $1.08 \times 580 = 626 \text{ psi}$

Because  $f'_c > 5000 \text{ psi}$ , use Eqs. (2.1) + (2.2b)

$$f'_{cr} = f'_c + 1.34 S_s = 6000 + 1.34 \times 626 = 6840 \text{ psi}$$

$$f'_{cr} = 0.9 f'_c + 2.33 S_s = 0.9 \times 6000 + 2.33 \times 626 = 6860 \text{ psi}$$

Use  $f'_{cr} = 6860 \text{ psi}$

(c) 30 prior tests for concrete with  $f'_c$  within

1000 psi of  $f'_c$  for project.  $S_s = 590 \text{ psi}$  -

$$f'_{cr} = f'_c + 1.34 S_s = 6000 + 1.34 \times 590 = 6790 \text{ psi}$$

$$f'_{cr} = 0.9 f'_c + 2.33 S_s = 0.9 \times 6000 + 2.33 \times 590 = 6770 \text{ psi}$$

Use  $f'_{cr} = 6790 \text{ psi}$

## 2.2

(a) For  $f'_c = 4000 \text{ psi}$ , the strength results indicate satisfactory concrete quality because (1) no individual test is below  $f'_c - 500 \text{ psi} = 3500 \text{ psi}$ , and (2) every arithmetic average of any three consecutive tests equals or exceeds  $f'_c$ .

(b) For  $S_s = 510 \text{ psi}$  for 30 consecutive tests, calculate  $f'_{cr}$  using Eqs (2.1) and (2.2a)  
$$f'_{cr} = f'_c + 1.34 S_s = 4000 + 1.34 \times 510 = 4680 \text{ psi}$$
$$f'_{cr} = f'_c + 2.33 S_s - 500 \text{ psi} = 4000 + 2.33 \times 510 - 500$$
$$= 4690 \text{ psi}$$

Use  $4690 \text{ psi}$

$$(4590 + 4750 + 5280 + 4210 + 4460 + 4170 + 3750 + 5110 + 4640 + 4170) / 10$$
$$= 4510 < f'_{cr}$$

Because the average compressive strength is less than  $f'_{cr}$ , the water-cement ratio must be decreased, either by adding cement or reducing water, to increase strength. If the water is reduced, a water reducer must be added or the quantity of water reducer must be increased to maintain concrete workability.

**Problem 3.1** A rectangular beam made using concrete with  $f'_c = 6000$  psi and steel with  $f_y = 60,000$  psi had a width  $b = 20$  in., and an effective depth of  $d = 17.5$  in and an  $h = 20$  in. The Concrete modulus of rupture  $f_r = 530$  psi. The elastic modulus of the steel and concrete are, respectively  $E_c = 4,030,000$  psi and  $E_s = 29,000,000$  psi. The area of steel is four No. 11 (No. 36) bars.

- Find the maximum service load that can be resisted without stressing the concrete above  $0.45 f'_c$  or the steel above  $0.40 f_y$ .
- Determine if the beam will show cracking before reaching the service load
- Compute the nominal moment capacity of the beam
- Compute the ratio of the nominal capacity of the beam to the maximum service level capacity and compare your findings to the ACI load factors and strength reduction factor.

▢ Reinforcement sizes

Given data

Note: for all MathCAD based solutions, the area and diameter of reinforcement bars is in a common database. Hence the notation  $A_{s11}$  indicates the area of a single No. 11 (No. 36) bar.

$$\begin{aligned}
 A_s &:= 4 \cdot A_{s11} & A_s &= 6.24 \text{ in}^2 & E_s &:= 29000000 \text{ psi} \\
 b &:= 20 \text{ in} & d &:= 17.5 \text{ in} & h &:= 20 \text{ in} \\
 f'_c &:= 6000 \text{ psi} & f_y &:= 60000 \text{ psi} & E_c &:= 57000 \sqrt{f'_c} \text{ psi} & E_c &= 4415 \text{ ksi} \\
 f_r &:= 7.5 \sqrt{f'_c} \text{ psi} & f_r &= 581 \text{ psi} & n &:= \frac{E_s}{E_c} & n &= 6.6
 \end{aligned}$$

- Find the maximum service load that can be resisted without stressing the concrete above  $0.45 f'_c$  or the steel above  $0.40 f_y$ .

$$\begin{aligned}
 f_c &:= 0.45 f'_c & f_c &= 2700 \text{ psi} \\
 f_s &:= 0.60 f_y & f_s &= 36000 \text{ psi} \\
 \rho &:= \frac{A_s}{b \cdot d} & \rho &= 0.018 \\
 k &:= \sqrt{(\rho \cdot n)^2 + 2 \rho \cdot n} - \rho \cdot n & k &= 0.381 \\
 j &:= 1 - \frac{k}{3} & j &= 0.873
 \end{aligned}$$

Moment due to concrete limits

$$M_{sc} := \frac{1}{2} \cdot f_c \cdot b \cdot k \cdot d \cdot \left( d - \frac{k \cdot d}{3} \right) \quad M_{sc} = 229 \cdot \text{ft} \cdot \text{kip}$$

Moment due to steel limit

$$M_{ss} := A_s \cdot f_s \cdot j \cdot d \quad M_{ss} = 286 \cdot \text{ft} \cdot \text{kip}$$

The maximum service moment is the minimum of the two values.

$$M_s := \min(M_{ss}, M_{sc}) \quad M_s = 229 \cdot \text{ft} \cdot \text{kip}$$

(b) Determine if the beam will show cracking before reaching the service load

$$I_g := \frac{b \cdot h^3}{12} \quad I_g = 13333 \cdot \text{in}^4$$

$$M_{cr1} := \frac{f_r \cdot I_g}{\frac{h}{2}} \quad M_{cr1} = 64.5 \cdot \text{ft} \cdot \text{kip}$$

This is less than the service load so the section cracks. To demonstrate that the transformed section does not affect this conclusion, the following checks the cracked transformed section.

$$\Delta y := \frac{n \cdot A_s \cdot \left(d - \frac{h}{2}\right)}{n \cdot A_s + b \cdot h} \quad \Delta y = 0.697 \cdot \text{in}$$

$$I_{ut} := I_g + b \cdot d \cdot \Delta y^2 + n \cdot A_s \cdot \left(d - \frac{h}{2} - \Delta y\right)^2 \quad I_{ut} = 15400 \cdot \text{in}^4$$

$$M_{cr2} := \frac{f_r \cdot I_{ut}}{\frac{h}{2} - \Delta y} \quad M_{cr2} = 80.1 \cdot \text{ft} \cdot \text{kip} \quad \frac{M_{cr2}}{M_{cr1}} = 1.242$$

(c) Determine the nominal moment capacity of the section.

$$a := \frac{A_s \cdot f_y}{0.85 f'_c \cdot b} \quad a = 3.67 \cdot \text{in}$$

$$M_n := A_s \cdot f_y \cdot \left(d - \frac{a}{2}\right) \quad M_n = 489 \cdot \text{ft} \cdot \text{kip}$$

(d) Compute the ratio of the nominal capacity of the beam to the maximum service level capacity and compare your findings to the ACI load factors and strength reduction factor.

$$\text{Ratio} := \frac{M_n}{M_s} \quad \text{Ratio} = 2.13$$

First, the extra computation of the uncracked transformed area gives only a 18% increase in the cracking moment. Comparing the cracking moment to the service moment shows that the service moment is almost 3 times the cracking moment. Therefore, unless the service moment is very close to the service moment, you can be assured that the section will crack based on the gross section calculation.

Second, the margin of safety between the service moment and the nominal capacity is 2.11. This is greater than the ultimate load factors and phi factors from ASCE-7 and ACI ( $1.8/0.9 = 2.00$  if the entire load is classified as live load) indicating that a service level design is more conservative than LRFD design.

3.2  $w_d = 500 \text{ plf}$   
 $w_L = 1200 \text{ plf}$   
 $L = 22'$

$f_c' = 3000 \text{ psi}$   
 $f_y = 60,000 \text{ psi}$   
 $\rho = 0.6 \rho_{max}$

Assume  $w_o = w_d = 500 \text{ plf}$   
 and check assumption at conclusion of  
 the design

$$w_u = 1.2(500 + 500) + 1.6(1200) = 3120 \text{ plf}$$

$$M_u = \frac{w_u L^2}{8} = \frac{3.12(22)^2}{8} = 189 \text{ ft-kip}$$

$$\rho_{max} = 0.85 \beta_1 \frac{f_c'}{f_y} \left( \frac{\epsilon_u}{\epsilon_u + 0.004} \right) = 0.85(0.85) \frac{3}{60} \left( \frac{0.003}{0.003 + 0.004} \right)$$

$$= 0.0155 \quad (\text{or from Table A.4})$$

$$\rho = 0.6 \rho_{max} = 0.6(0.0155) = 0.0093$$

$$R = \rho f_y \left( 1 - 0.588 \frac{\rho f_y}{f_c'} \right) = 0.0093(60000) \left( 1 - 0.588 \frac{0.0093(60)}{3} \right)$$

$$R = 497 \quad (\text{or by interpolation from Table A.5b})$$

Since  $\rho = 0.6 \rho_b$  assume  $\phi = 0.9$  (Confirmed by Table A.4)

$$bd^2 = \frac{M_u}{\phi R} = \frac{189(12000)}{0.9(497)} = 5070$$

$$d = h - 2.5 = 16 - 2.5 = 13.5$$

Solve for  $b$

$$b = \frac{5070}{13.5^2} = 27.8$$

Use  $b = 28 \text{ in}$

Check weight assumption  $w_o = \frac{16 \times 28}{144}(150) = 467 \text{ plf}$   
 which is less than assumed.

$$A_s = \rho bd = 0.0093(27.8)(13.5) = 3.49 \text{ in}^2$$

$$3 \#10 (\#36) = 3.81 \text{ in}^2$$

3.3

$$L = 20'$$

$$w_s = 2450 \text{ plf}$$

$$w_o = \frac{12 \times 25}{144} (150) = 313 \text{ plf}$$

$$M_s = \frac{wL^2}{8} = \frac{(2450 + 313)(20)^2}{8} \frac{1}{1000}$$

$$= 138 \text{ ft kip}$$

a)

$$a = \frac{A_s f_y}{0.85 f'_c b} = \frac{3.0(60)}{0.85(4)(12)} = 4.41 \text{ in}$$

$$M_u = A_s f_y \left(d - \frac{a}{2}\right) = 3.0(60) \left(23 - \frac{4.41}{2}\right) \frac{1}{12} = 311 \text{ ft kips}$$

$$FS = \frac{M_u}{M_s} = \frac{311}{138} = 2.26$$

This exceeds the target value of 1.85

b)

$$n = 8 \quad \text{from } E_c = 57,000 \sqrt{f'_c} = 3,600,000$$

$$\rho = \frac{A_s}{bd} = \frac{3}{12 \times 23} = 0.0109$$

From Table A.6  $k = 0.339$ ,  $j = 0.887$  by interpolation

$$\text{or } k = \sqrt{(8 \times 0.0109)^2 + 2.8 \times 0.0109} - 8(0.0109) = 0.339$$

$$f_s = \frac{M_s}{A_s j d} = \frac{138(12000)}{3(0.887)23} = 27,600 \text{ psi}$$

$$f_c = \frac{M_s}{k j b d^2} = \frac{138(12000)}{0.339(0.887)12(23)^2} = 868 \text{ psi}$$

$$c) \quad f_r = 7.5 \sqrt{f'_c} = 7.5 \sqrt{4000} = 474 \text{ psi}$$

$$I_g = \frac{bh^3}{12} = \frac{12(25)^3}{12} = 15,625 \text{ in}^4$$

$$M_{cr} = \frac{f_r I}{\gamma} = \frac{474(15,625)}{25/2} \frac{1}{12000} = 49.4 \text{ ft k}$$

$M_{cr} \ll M_s \quad \therefore \text{Beam will crack}$

**Problem 3.4** A rectangular reinforced concrete section has dimension  $b=14$  in.,  $d=25$  in., and  $h = 28$  in., and is reinforced with 3 No. 10 (No. 32) bars. The material strengths are  $f'_c = 5000$  psi,  $f_y = 60,000$  psi.

- Find the moment that will produce first cracking at the bottom surface of the section basing your calculations on  $I_g$ , the moment of inertial of the gross section.
- Repeat the calculation using  $I_{ut}$ , the uncracked transformed moment of inertia.
- Determine the maximum moment that can be carried without the concrete stress exceeding  $0.45 f'_c$  or the steel stress exceeding  $0.60 f_y$ .
- Determine the nominal moment capacity of the section.
- Compute the ratio of nominal moment capacity from part (d) to the service level moment from part (c)
- Comment on your results with particular attention to comparing parts (a) and (b) and comparing part (e) to established load factors.

► Reinforcement sizes

Given data

$$\begin{aligned} A_s &:= 3 \cdot A_{s10} & A_s &= 3.81 \text{ in}^2 & E_s &:= 29000000 \text{ psi} \\ b &:= 14 \text{ in} & d &:= 25 \text{ in} & h &:= 28 \text{ in} \\ f'_c &:= 5000 \text{ psi} & f_y &:= 60000 \text{ psi} & E_c &:= 57000 \sqrt{f'_c} \text{ psi} & E_c &= 4031 \text{ ksi} \\ f_r &:= 7.5 \sqrt{f'_c} \text{ psi} & f_r &= 530 \text{ psi} & n &:= \frac{E_s}{E_c} & n &= 7.2 \end{aligned}$$

- Find the moment that will produce first cracking at the bottom surface of the section basing your calculations on  $I_g$ , the moment of inertial of the gross section.

$$I_g := \frac{b \cdot h^3}{12} \quad I_g = 25611 \text{ in}^4 \quad M_{cr1} := \frac{f_r \cdot I_g}{\frac{h}{2}} \quad M_{cr1} = 80.8 \text{ ft} \cdot \text{kip}$$

- Repeat the calculation using  $I_{ut}$ , the uncracked transformed moment of inertia.

$$\begin{aligned} \Delta y &:= \frac{n \cdot A_s \cdot \left(d - \frac{h}{2}\right)}{n \cdot A_s + b \cdot h} & \Delta y &= 0.719 \text{ in} \\ I_{ut} &:= I_g + b \cdot d \cdot \Delta y^2 + n \cdot A_s \cdot \left(d - \frac{h}{2} - \Delta y\right)^2 & I_{ut} &= 28689 \text{ in}^4 \\ M_{cr2} &:= \frac{f_r \cdot I_{ut}}{\frac{h}{2} - \Delta y} & M_{cr2} &= 95.5 \text{ ft} \cdot \text{kip} & \frac{M_{cr2}}{M_{cr1}} &= 1.181 \end{aligned}$$

- Determine the maximum moment that can be carried without the concrete stress exceeding  $0.45 f'_c$  or the steel stress exceeding  $0.60 f_y$ .

$$f_c := 0.45 f'_c \quad f_c = 2250 \text{ psi}$$

$$f_s := 0.60f_y$$

$$f_s = 36000 \text{ psi}$$

$$\rho := \frac{A_s}{b \cdot d}$$

$$\rho = 0.011$$

$$k := \sqrt{(\rho \cdot n)^2 + 2\rho \cdot n - \rho \cdot n} \quad k = 0.325 \quad j := 1 - \frac{k}{3} \quad j = 0.892$$

Moment due to concrete limits

Moment due to steel limit

$$M_{sc} := \frac{1}{2} \cdot f_c \cdot b \cdot k \cdot d \cdot \left( d - \frac{k \cdot d}{3} \right) \quad M_{sc} = 238 \text{ ft} \cdot \text{kip} \quad M_{ss} := A_s \cdot f_s \cdot j \cdot d \quad M_{ss} = 255 \text{ ft} \cdot \text{kip}$$

The maximum service moment is the minimum of the two values.

$$M_s := \min(M_{ss}, M_{sc}) \quad M_s = 238 \text{ ft} \cdot \text{kip}$$

(d) Determine the nominal moment capacity of the section.

$$a := \frac{A_s \cdot f_y}{0.85f_c \cdot b}$$

$$a = 3.84 \text{ in}$$

$$M_n := A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) \quad M_n = 440 \text{ ft} \cdot \text{kip}$$

(e) Compute the ratio of nominal moment capacity from part (d) to the service level moment from part (c)

$$\text{Ratio} := \frac{M_n}{M_s}$$

$$\text{Ratio} = 1.85$$

$$0.9 \text{ Ratio} = 1.66$$

$$\text{Ratio1} := \frac{M_s}{M_{cr1}}$$

$$\text{Ratio1} = 2.942$$

(f) Comment on your results with particular attention to comparing parts (a) and (b) and comparing part (e) to established load factors.

First, the extra computation of the uncracked transformed area gives an 18% increase in the cracking moment. Comparing the cracking moment to the service moment, Ratio1, shows that the service moment is almost 3 times the cracking moment. Therefore, unless the service moment is very close to the service moment, you can be assured that the section will crack.

Second, the margin of safety between the service moment and the nominal capacity is 1.8, 1.6 if a  $\phi$  factor is included. This is greater than the ultimate load factors from ASCE-7 indicating that a service level design is far more conservative than LRFD design.

$$3.5 \quad f_y = 60,000 \text{ psi} \quad f'_c = 5000 \text{ psi}$$

$$a) \quad A_s = 2 \#8 = 2(0.79) = 1.58 \text{ in}^2$$

$$a = \frac{1.58(60)}{.85(5)12} = 1.86 \text{ in}$$

$$M_n = A_s f_y \left( d - \frac{a}{2} \right) = 1.58(60) \left( 20 - \frac{1.86}{2} \right) \frac{1}{12}$$

$$= 151 \text{ ft kips}$$

$$b) \quad A_s = 2 \#10 = 2(1.27) = 2.54 \text{ in}^2$$

$$a = \frac{A_s f_y}{.85 f'_c b} = \frac{2.54(60)}{.85(5)12} = 2.99 \text{ in}$$

$$M_n = 2.54(60) \left( 20 - \frac{2.99}{2} \right) \frac{1}{12}$$

$$= 235 \text{ ft kips}$$

$$c) \quad A_s = 3 \#10 = 3(1.27) = 3.81 \text{ in}^2$$

$$a = \frac{3.81(60)}{.85(5)(12)} = 4.48 \text{ in}$$

$$M_n = 3.81(60) \left( 20 - \frac{4.48}{2} \right) \frac{1}{12}$$

$$= 338 \text{ ft kips}$$

A check of net tensile strain shows  $\epsilon_t = 0.0077$  so tensile steel has yielded.

**Problem 3.6** A singly reinforced rectangular beam is to be designed, with an effective depth approximately 1.5 times the width, to carry a service load of 2000 lb/ft in addition to its own weight, on a 24 ft. simple span. The ACI Code factors are applied as usual. With  $f_y = 60,000$  psi and  $f'_c = 4000$  psi, determine the required concrete dimensions  $d$ ,  $b$ , and  $h$ , and steel reinforcing bars for a)  $\rho = 0.6 \rho_{\max}$  and b)  $\rho = \rho_{0.005}$ . Include a sketch, to scale, of each cross section. Allow for No. 4 (No. 13) stirrups. Comment on your results.

Given properties

$$f_y := 60000 \text{ psi} \quad f'_c := 4000 \text{ psi} \quad l := 24 \text{ ft} \quad w_l := 2000 \cdot \frac{\text{lb}}{\text{ft}} \quad w_c := 150 \cdot \frac{\text{lb}}{\text{ft}^3}$$

Estimate beam dimensions for self weight determination

$$b := 12 \cdot \text{in} \quad d := 18 \cdot \text{in} \quad h := 21 \cdot \text{in}$$

$$w_o := b \cdot h \cdot w_c$$

$$w_u := 1.2 \cdot w_o + 1.6 \cdot w_l \quad w_u = 3.515 \frac{\text{kip}}{\text{ft}}$$

$$M_u := w_u \cdot \frac{l^2}{8} \quad M_u = 253.1 \text{ kip} \cdot \text{ft}$$

$$\beta_1 := 0.85 - \frac{0.05(f'_c - 4000 \text{ psi})}{1000 \text{ psi}} = 0.85$$

$$\rho_{\max} := 0.85 \cdot \beta_1 \cdot \frac{f'_c}{f_y} \cdot \frac{0.003}{0.003 + 0.004} = 0.0206$$

a) For  $\rho = 0.6 \rho_{\max}$ , find the section properties to carry  $M_u$ .

$$\rho := 0.6 \rho_{\max} \quad \rho = 0.0124 \quad \text{From table} \quad \text{Resistance} := \rho \cdot f_y \cdot \left( 1 - 0.588 \cdot \frac{\rho \cdot f_y}{f'_c} \right)$$

$$\text{Resistance} = 662 \text{ psi} \quad \text{Since } \rho < \rho_{0.005}, \text{ then } \phi := 0.90$$

$$b := \sqrt[3]{\frac{M_u}{2.25 \cdot \phi \cdot \text{Resistance}}} = 13.134 \text{ in} \quad d := 1.5 \cdot b \quad d = 19.7 \text{ in}$$

$$A_s := \rho \cdot b \cdot d \quad A_s = 3.2 \text{ in}^2$$

A solution is to use 4-#8,  $b = 14$ ",  $d = 20.5$ ", and  $h = 22$ ".

$$A_s := 4 \cdot 0.79 \text{ in}^2 \quad b := 14 \text{ in} \quad d := 20.5 \text{ in} \quad \text{giving a design capacity of}$$

$$a := \frac{A_s \cdot f_y}{0.85 \cdot f'_c \cdot b} = 3.98 \text{ in}$$

$$\phi M_n := \phi \cdot A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) \quad \phi M_n = 263 \text{ ft} \cdot \text{kip} \quad > M_u \quad M_u = 253.1 \text{ ft} \cdot \text{kip} \quad \text{OK}$$

$$\begin{aligned}
 \text{b) } \rho_{005} &:= 0.85 \cdot \beta_1 \cdot \frac{f_c}{f_y} \cdot \frac{0.003}{0.003 + 0.005} \\
 \rho &:= \rho_{005} \quad \rho = 0.0181 \\
 \text{Resistance} &:= \rho \cdot f_y \cdot \left( 1 - 0.588 \cdot \rho \cdot \frac{f_y}{f_c} \right) \quad \text{Resistance} = 911 \text{ psi} \\
 b &:= \sqrt[3]{\frac{M_u}{1.5^2 \cdot \phi \cdot \text{Resistance}}} = 11.8 \text{ in} \quad d := 1.5 \cdot b \quad d = 17.7 \text{ in} \\
 A_s &:= \rho \cdot b \cdot d \quad A_s = 3.78 \text{ in}^2
 \end{aligned}$$

This is satisfied by 4-#9  $A_s = 4.0 \text{ in}^2$ . Beam dimensions would be  $b = 12"$ ,  $d = 18"$  and  $h = 21"$  (or more when two layers of steel are used). The increase in depth accounts for the smaller area of steel.

Check:

$$\begin{aligned}
 b &:= 12 \text{ in} \quad d := 18 \text{ in} \quad A_s := 4 \cdot 1.0 \text{ in}^2 = 4.0 \text{ in}^2 \\
 a &:= \frac{A_s \cdot f_y}{0.85 \cdot f_c \cdot b} \quad a = 5.88 \text{ in} \\
 \phi M_n &:= \phi \cdot A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) \quad \phi M_n = 271.1 \text{ ft} \cdot \text{kip} > M_u \text{ OK}
 \end{aligned}$$

**Comment:** While there is a small savings in concrete using solution b, the final selection of reinforcement can often result in a reinforcement ratio greater than the code allows. In which case, the solution in a) is preferable.

- 3.7** A four span continuous beam of constant rectangular cross-section is supported at A, B, C, D, and E. The factored moments resulting from analysis are

At Supports, ft-kip	At midspan ft-kip
$M_a = 138$	$M_{ab} = 158$
$M_b = 220$	$M_{bc} = 138$
$M_c = 200$	$M_{cd} = 138$
$M_d = 220$	$M_{de} = 158$
$M_e = 138$	

Determine the required final concrete dimensions for this beam using  $d=1.75 b$  and determine the reinforcement requirements at each critical moment section. Your final reinforcement ratio should not exceed  $\rho = 0.6 \rho_{005}$ ,  $f_y = 60,000$  psi and  $f'_c = 6000$  psi

#### ► Reinforcement Details

##### Given Properties

$$f'_c := 6000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad \epsilon_u := 0.003$$

$$\beta_1 := 0.85 - 0.05 \cdot \frac{f'_c - 4000 \text{ psi}}{1000 \text{ psi}} = 0.75 \quad \phi := 0.90$$

##### Solution Approach:

Solve the first section using the Resistance Factors. Then, having selected a section, determine the reinforcement requirements for the remaining sections. Choose reinforcement bars to meet your criteria.

$$M_{n\text{reqd}} := \frac{220 \text{ ft} \cdot \text{kip}}{\phi} \quad M_{n\text{reqd}} = 244 \text{ ft} \cdot \text{kip}$$

$$\rho_{005} := \frac{0.85 \cdot \beta_1 \cdot f'_c}{f_y} \cdot \left( \frac{\epsilon_u}{\epsilon_u + 0.005} \right) = 0.024 \quad \rho := 0.6 \rho_{005} = 0.014$$

$$R := \rho \cdot f_y \cdot \left( 1 - .588 \cdot \frac{\rho \cdot f_y}{f'_c} \right) \quad R = 788 \text{ psi}$$

$$b := \sqrt[3]{\frac{M_{n\text{reqd}}}{1.75^2 \cdot R}} = 10.7 \text{ in} \quad d := 1.75 \cdot b = 18.7 \text{ in}$$

$$A_s := b \cdot d \cdot \rho = 2.86 \text{ in}^2 \quad n := \frac{A_s}{A_{s8}} = 3.6$$

Try the following dimensions and then check the solution

$$b := 10 \text{ in} \quad h := 22 \text{ in} \quad d := h - 4 \text{ in} \quad \text{Additional cover is required because the bars have to be in two layers, See Table A.7 in text.}$$

$$A_s := 4 \cdot A_{s8} \quad A_s = 3.16 \text{ in}^2 \quad \text{Note: } \#10 \text{ (No. 36) also works and allows the steel to be in one layer but require more steel.}$$

$$a := \frac{A_s \cdot f_y}{0.85 \cdot f_c' \cdot b} = 3.72 \text{ in} \quad M_{n1} := A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) \quad M_{n1} = 255 \text{ ft} \cdot \text{kip} \quad \frac{M_{n1}}{M_{n\text{reqd}}} = 1.04 \quad \text{OK}$$

The next largest moment is 200 ft-kip. This is 10 percent less than the first interior joint so no adjustment of reinforcement is needed.

The largest positive moment is 158 ft-kip. This is 72 percent of the maximum moment so the steel requirements will be approximately:

$$A_{s2} := 0.72 A_s = 2.28 \text{ in}^2 \quad n_2 := \frac{A_{s2}}{A_{s8}} \quad n_2 = 2.88 \quad \text{use:} \quad A_s := 3 A_{s8}$$

From Table A.7 use 3-#8 bars in one level

$$d_2 := h - 2.5 \text{ in} \quad a := \frac{A_s \cdot f_y}{0.85 f_c' \cdot b} = 2.79 \text{ in} \quad M_{nab} := A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) = 197 \text{ ft} \cdot \text{kip}$$

$$\text{Check total Capacity} \quad \frac{\phi \cdot M_{nab}}{158 \text{ ft} \cdot \text{kip}} = 1.12 \quad \text{OK}$$

Design end negative moment at A and E

$$A_{s2} := \frac{138}{158} \cdot A_s = 2.07 \text{ in}^2 \quad \text{Use 3\#8} \quad A_s := 3 A_{s8} = 2.37 \text{ in}^2$$

$$a := \frac{A_s \cdot f_y}{0.85 f_c' \cdot b} = 2.79 \text{ in} \quad M_{n2} := A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) \quad M_{n2} = 197 \text{ ft} \cdot \text{kip}$$

$$\text{Check total Capacity} \quad \frac{\phi \cdot M_{n2}}{158 \text{ ft} \cdot \text{kip}} = 1.12 \quad \text{OK}$$

**Problem 3.8** A two span continuous beam is supported on three concrete walls spaced 30 ft. on centers. A service live load of 1.5 kip/ft is to be carried in addition to the self weight of the beam and is to be applied in a pattern loading. The dimensions of the beam should be approximately  $d=2b$ , and the reinforcement is to be varied according to the demand. Determine concrete dimensions at all critical sections but select a constant section for the beam. Allow for No. 4 (No. 13) stirrups. Use a span to depth ratio of 15 for your first estimate of the depth. Adjust the depth if the reinforcement ratio is too high. Include sketches drawn to scale. Use  $f'_c = 6000$  psi and  $f_y = 60,000$  psi.

#### Reinforcement Details

##### Given Properties

$$f'_c := 6000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad \phi := 0.90 \quad \beta_1 := 0.85 - 0.05 \cdot \frac{f'_c - 4000 \text{ psi}}{1000 \text{ psi}} = 0.75$$

$$w_l := 1.5 \frac{\text{kip}}{\text{ft}} \quad L := 30 \text{ ft} \quad \gamma_c := 150 \text{ pcf}$$

**Solution:** Begin by estimating a beam depth and width, then compute the girder load. Compute the maximum negative moment due to both spans being loaded then the maximum positive moment with only one span loaded with live load. Try:

$$h := \frac{L}{15} = 24 \text{ in} \quad d := h - 2.5 \text{ in} = 21.5 \text{ in} \quad b := \frac{h}{2} = 12.0 \text{ in}$$

$$w_g := \gamma_c \cdot b \cdot h = 0.30 \frac{\text{kip}}{\text{ft}} \quad w_u := 1.2w_g + 1.6w_l = 2.76 \frac{\text{kip}}{\text{ft}}$$

$$M_{\text{neg}} := \frac{w_u \cdot L^2}{8} = 310 \text{ ft} \cdot \text{kip}$$

By trial estimate  $a$ , then compute  $A_s$  for the negative moment over the support, select final  $A_s$  and check  $M_n$

$$a := 4.0 \text{ in} \quad A_s := \frac{M_{\text{neg}}}{\phi \cdot f_y \cdot \left(d - \frac{a}{2}\right)} = 3.54 \text{ in}^2 \quad \text{Try 3-}\#10 \quad A_s := 3 \cdot A_{s10} = 3.81 \text{ in}^2$$

$$a := \frac{A_s \cdot f_y}{0.85 \cdot f'_c \cdot b} = 3.74 \text{ in} \quad M_n := A_s \cdot f_y \cdot \left(d - \frac{a}{2}\right) = 374 \text{ ft} \cdot \text{kip} \quad \phi \cdot M_n = 337 \text{ ft} \cdot \text{kip} \text{ OK}$$

$$c := \frac{a}{\beta_1} = 4.98 \text{ in} \quad \frac{c}{d} = 0.232 < 3/8 \text{ therefore } \phi = 0.9 \text{ is OK}$$

By trial, compute the required  $A_s$  for the positive moment condition.

The maximum positive moment occurs with dead load on both spans and live load on one span only. The maximum moment for the DL occurs at  $3/8L$  in from the end and the maximum moment for live load occurs  $7/16L$  in from the end. Conservatively, take the sum of the two conditions and apply them at the same location.

$$M_{\text{pos}} := \frac{49 \cdot 1.6w_l \cdot L^2}{512} + \frac{9 \cdot 1.2w_g \cdot L^2}{128} = 229 \text{ ft} \cdot \text{kip}$$

$$a := 3.0 \text{ in} \quad A_s := \frac{M_{\text{pos}}}{\phi \cdot f_y \cdot \left(d - \frac{a}{2}\right)} = 2.55 \text{ in}^2 \quad \text{Try 3-}\#9 \quad A_s := 3 \cdot A_{s9} = 3.00 \text{ in}^2$$

$$a := \frac{A_s \cdot f_y}{0.85 \cdot f_c' \cdot b} = 2.94 \text{ in} \quad M_n := A_s \cdot f_y \cdot \left(d - \frac{a}{2}\right) = 300 \text{ ft} \cdot \text{kip} \quad \phi \cdot M_n = 270 \text{ ft} \cdot \text{kip OK}$$

$$c := \frac{a}{\beta_1} = 3.92 \text{ in} \quad \frac{c}{d} = 0.182 < 3/8 \text{ therefore } \phi = 0.9 \text{ is OK}$$

Section at midspan

Section at interior support

# BACKGROUND FOR PROBLEM 3.8

$$M_+ = \frac{1}{2} \cdot \frac{3}{8} \cdot \frac{3}{8} wL^2$$

$$= \frac{9wL^2}{128}$$

$$M_+ = \frac{1}{2} \cdot \frac{7}{16} \cdot \frac{7}{16} wL^2 = \frac{49wL^2}{512}$$

Combined effect  $w_D = \text{continuous}$ ,  $w_L = \text{one span}$

$$\bar{x} = \frac{\left(\frac{3}{8}w_D L + \frac{7}{16}w_L L\right)L}{(w_D + w_L)L}$$

$$= \frac{\frac{7}{16}w_L + \frac{3}{8}w_D}{w_D + w_L} L$$

Both  $w_D$  and  $w_L$  are factored loads

$$M_+ = \frac{1}{2} \left[ \frac{7}{16}w_L + \frac{3}{8}w_D \right] L \bar{x}$$

3.9  $f_y = 60,000 \text{ psi}$ ,  $f'_c = 4,000 \text{ psi}$

$$\rho_b = .85 \rho_1 \frac{f'_c}{f_y} \frac{\epsilon_u}{\epsilon_u + \epsilon_y}$$

$$= .85(.85) \frac{4}{60} \left( \frac{.003}{.003 + .00207} \right) = 0.0285$$

$$\bar{\rho}_{cy} = 0.85 \rho_1 \frac{f'_c d'}{f_y d} \frac{\epsilon_u}{\epsilon_u - \epsilon_y} + \rho'$$

$$= .85(.85) \frac{4}{60} \frac{2.5}{12} \frac{.003}{.003 - .00207} + \frac{1.58}{12 \times 18}$$

$$= 0.0289$$

$$\rho' = \frac{A_s'}{bd} = \frac{1.58}{12 \times 18} = 0.0073$$

a)  $A_s = 3.8 \text{ in}^2$   $\rho = \frac{3.8}{12 \times 18} = 0.0176$

$\rho < \rho_b \therefore f_s = f_y$   $\rho < \bar{\rho}_{cy} \therefore f'_s < f_y$

by trial  $f'_s = 41 \text{ ksi}$   $A_s = 3.8 - 1.58 \left( \frac{41}{60} \right) = 2.73 \text{ in}^2$

$$a = \frac{2.73(60)}{.85(4)12} = 4.01 \text{ in} \quad c = \alpha \rho_1 = 4.0 / .85 = 4.72$$

$$f'_s = E_s \frac{c - d'}{c} \epsilon_s = 29,000 \frac{4.72 - 2.5}{4.72} (.003) = 41.4 \text{ ksi OK}$$

$$M_n = 1.58(41)(18 - 2.5) + 2.73(60) \left( 18 - \frac{4.01}{2} \right) = 3624 \text{ in-kip} = 302 \text{ ft-kip}$$

b)  $A_s = 5.08 \text{ in}^2$   $\rho = \frac{5.08}{12 \times 18} = 0.0235$

$\rho < \rho_b \therefore f_s = f_y$ ,  $\rho < \bar{\rho}_{cy} \therefore f'_s < f_y$

by trial  $f'_s = 52 \text{ ksi}$   $A_s = 5.08 - \frac{52}{60} 1.58 = 3.71 \text{ in}^2$

$$a = \frac{3.71(60)}{.85(4)12} = 5.46 \text{ in} \quad c = \frac{5.46}{0.85} = 6.42$$

$$f'_s = 29,000 \frac{6.42 - 2.5}{6.42} (.003) = 53.1 \text{ ksi} \quad \text{OK use } 53 \text{ ksi}$$

$$M_n = 1.58(53)(18 - 2.5) + 3.71(60) \left( 18 - \frac{5.46}{2} \right) = 4697 \text{ in-kip} = 391 \text{ ft-kip}$$

c)  $A_s = 6.0 \text{ in}^2$   $\rho = \frac{6.0}{12 \times 18} = 0.0278$

$\rho < \rho_b$   $f_s = f_y$   $\rho < \bar{\rho}_{cy}$   $f'_s < f_y$  but very close

Assume  $f'_s = f_y$

$$a = \frac{(6.0 - 1.58)60}{.85(4)12} = 6.50 \text{ in} \quad c = \frac{6.50}{.85} = 7.65 \text{ in}$$

$$M_n = 1.58(60)(18 - 2.5) + (6.0 - 1.58)60 \left( 18 - \frac{6.50}{2} \right) = 5381 \text{ in-kip} = 448 \text{ ft-kip}$$

Check  $f'_s = 29,000 \frac{7.65 - 2.5}{7.65} (.003) = 58.6 \text{ ksi} > f_y$  (cont.)

3.9 (Con't.)

Note: for comparison purposes

Case		"exact"	Assume $A_s'$ yields	Ignore $A_s'$
a	$M_n$	302	305	290
	$\frac{M_n}{M_n \text{ "Exact"}}$	1.000	1.010	0.960
b	$M_n$	391	392	362
	$\frac{M_n}{M_n \text{ "Exact"}}$	1.000	1.003	0.926
c	$M_n$	448	448	408
	$\frac{M_n}{M_n \text{ "Exact"}}$	1.000	1.000	0.911

3.10  $f'_c = 4000 \text{ psi}$ ,  $f_y = 60,000 \text{ psi}$

$M_u = 400 \text{ ft-kips}$

First, try a singly reinforced beam with  
 $\rho = \rho_{0.05} = 0.0181$  to assure  $\phi = 0.9$

$A_s = \rho b d = 0.0181(24 \times 13) = 5.65 \text{ in}^2$

$a = \frac{A_s f_y}{0.85 f'_c b} = \frac{5.65(60)}{0.85(4) 24} = 4.15 \text{ in}$

$M_n = A_s f_y (d - \frac{a}{2}) = 5.65(60)(13 - \frac{4.15}{2}) \frac{1}{12} = 309 \text{ ft-kips}$

$M_n < M_u$   $\therefore$  must add compression reinforcement.

From table 3.2 we know  $f'_s < f_y$   $c = \frac{a}{\beta_1} = \frac{4.14}{0.85} = 4.87 \text{ in}$

$f'_s = E_s \epsilon_s \leq \epsilon_u \frac{E_s d'}{c} = 29,000(0.003) \frac{4.87 - 3}{4.87} = 33.4 \text{ ksi}$  USE 33 ksi

$M_{n2} = \frac{M_u}{\phi} - M_{n1} = \frac{400}{0.9} - 308 = 136.4 \text{ ft-kips}$

$A'_s = \frac{M_{n2}}{f'_s (d - d')} = \frac{136.4(12)}{33(13 - 3)} = 4.96$

TRY  $4 \#10 (\#32) = 5.08 \text{ in}^2$

Positive reinforcement at  $f_y = 60 \text{ ksi}$

$A_s = 5.64 \text{ in}^2 + 4.96 \left( \frac{33}{60} \right) = 8.37 \text{ in}^2$

TRY  $7 \#10 (\#32) A_s = 8.89 \text{ in}^2$

Because  $A_s > A_s$  for  $\rho = 0.0181$ ,  $\epsilon_t$  &  $\phi$  need to be checked

by trial  $f'_s = 35.5 \text{ ksi}$

$a = \frac{(8.89 - 5.08 \left( \frac{35.5}{60} \right)) 60}{0.85(4) 24} = 4.33 \text{ in}$   $c = 4.33 / 0.85 = 5.09 \text{ in}$

Check  $f'_s = 29,000(0.003) \frac{5.09 - 3}{5.09} = 35.7$  OK use 35.5 ksi

$M_n = 5.08(35.5)(13 - 3) + \left[ 8.89 - 5.08 \left( \frac{35.5}{60} \right) \right] 60 \left( 13 - \frac{4.33}{2} \right) \frac{1}{12} = 5629 \text{ in-k} = 469 \text{ ft-k}$

$\epsilon_t = 0.003 \frac{d - c}{c} = 0.003 \frac{13 - 5.09}{5.09} = 0.00466$

$\phi = 0.9 - 0.25 \left[ \frac{0.005 - 0.00466}{0.001} \right] = 0.81$

$\phi M_n = 0.81(469) = 382 \text{ ft-kips} < M_u$

Revise design by increasing the compression reinforcement

try  $4 \#11 (\#36) A'_s = 6.24 \text{ in}^2$

increasing positive reinforcement lowers  $\phi$  (con't.)

3.10 (cont.)

by trial  $f'_s = 32.5 \text{ ksi}$  (see 3.11 for trial convergence)

$$a = \frac{[8.89 - 6.24(\frac{32.5}{60})]60}{.85(4)24} = 4.05 \text{ in} \quad c = \frac{4.05}{.85} = 4.77 \text{ in}$$

$$\text{check } f'_s = 29,000(.003) \frac{4.77-3}{4.77} = 32.3 \quad \text{ok use } 32.5 \text{ ksi}$$

$$M_n = 6.24(32.5)(13-3) + (8.89-6.24\frac{32.5}{60})60(13-\frac{4.05}{2})$$

$$= 5656 \text{ in-kips} = 471 \text{ ft-kips}$$

$$\text{Check } \epsilon_t \quad \epsilon_t = .003 \frac{d-c}{c} = .003 \left( \frac{13-4.77}{4.77} \right) = 0.00518$$

$$\epsilon_t > .005 \quad \phi = 0.9$$

$$\phi M_n = 471(0.9) = 424 \text{ ft-kips} > M_u \quad \text{OK}$$

Use 4 #11 (#36) compression

7 #10 (#32) Tension

**Problem 3.11** For the beam with a triangular cross section shown in Figure P3.11, determine a) the balanced reinforcement ratio and b) the maximum reinforcement ratio if  $\epsilon_t = 0.005$ . The dimensions of the triangle are such that the width of the triangle equals the distance from the apex. The width at the effective width  $b$  equals the effective depth  $d$ . Draw the strain distribution, stress distribution, and define your notation.

### SOLUTION

a) Find the balanced reinforcement ratio

From Equilibrium

$$C = T$$

$$0.85f'_c (1/2 a b_a) = A_s f_y$$

Substitution  $A_s = \rho b d$ , where  $b = d$  and  $b_a = a$  gives

$$0.85f'_c a^2/2 = \rho d^2 f_y$$

Solve for  $\rho$

$$\rho = \frac{0.85 f'_c}{2 f_y} \left( \frac{a}{d} \right)^2$$

The relationship between  $a$  and  $c$  is  $a = \beta_1 c$ . From the relationship of plane sections remain plane, the correlation of  $c/d$  is

$$\frac{c}{d} = \frac{\epsilon_u}{\epsilon_u + \epsilon_t}$$

Substitution for a and then c/d gives

$$\rho = \frac{0.85}{2} \frac{f'_c}{f_y} \beta_1^2 \left( \frac{\epsilon_u}{\epsilon_u + \epsilon_t} \right)^2$$

For the balanced condition,  $\epsilon_t = \epsilon_y$  and  $\rho_b$  is

$$\rho_b = \frac{0.85}{2} \frac{f'_c}{f_y} \beta_1^2 \left( \frac{\epsilon_u}{\epsilon_u + \epsilon_y} \right)^2$$

Using grade 60 steel, so  $\epsilon_y$  is 0.002 and  $\epsilon_u = 0.003$ , the balanced ratio becomes.

$$\rho_b = 0.153 \beta_1^2 \frac{f'_c}{f_y} \quad \text{<=Solution for balanced ratio}$$

**b) Find the reinforcement ratio for  $\epsilon_t = 0.005$ .**

For  $\epsilon_t = 0.005$  and  $\epsilon_u = 0.003$  the reinforcement ratio is

$$\rho_{0.005} = 0.060 \beta_1^2 \frac{f'_c}{f_y} \quad \text{<=Solution for reinforcement ratio when } \epsilon_t = 0.005$$

**Problem 3.12** Develop a design table and chart for the moment capacity of rectangular concrete beams based on the use of the flexural resistance factor  $R$  (See table A.5a and Graph A.1a for examples). Material strengths are  $f_y = 60,000$  psi, and  $f_c' = 8000$  psi. The table and graph should begin with  $\rho_{\min}$  and end at  $\rho_{\max}$ . You must show how the maximum and minimum values for  $\rho$  were computed. You may use Excel or MathCAD to perform your calculations. Your submittal must include a table, a graph, and commentary on how you checked the work.

► Reinforcement Details

Given Properties

$$f_c' := 8000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad \phi := 0.90 \quad \beta_1 := 0.85 - 0.05 \cdot \frac{f_c' - 4000 \text{ psi}}{1000 \text{ psi}} = 0.65$$

$$\rho_{\min} := \max \left( \frac{200 \text{ psi}}{f_y}, \frac{3 \sqrt{f_c' \text{ psi}}}{f_y} \right) = 0.0045$$

$$\rho_{\max} := 0.85 \beta_1 \cdot \frac{f_c'}{f_y} \cdot \left( \frac{0.003}{0.003 + 0.005} \right) = 0.028$$

$$\rho := \rho_{\min} \cdot 0.005 \dots \rho_{\max}$$

$$R(\rho) := \rho \cdot f_y \cdot \left( 1 - 0.588 \rho \cdot \frac{f_y}{f_c'} \right)$$

3.13 A rectangular beam made using concrete with  $f'_c = 5000$  psi and steel with  $f_y = 60,000$  psi has a width of  $b = 18$  in., an effective depth of  $d = 21$  in., and a total depth of  $h = 24$  in. The beam is reinforced with 4 - No. 9 (No. 29) bars. Compute the nominal moment capacity assuming a) an equivalent rectangular stress block, b) a triangular stress block with a peak value of  $f'_c$  and c) a parabolic stress block with a peak value of  $f'_c$  (see Fig. P3.13). Compare and comment on your results knowing that the rectangular stress block correlates within 4% of test results.

Triangle Properties

Parabola properties

#### Reinforcement Details

Given Properties

$$f'_c := 5000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad \beta_1 := 0.85 - 0.05 \cdot \frac{f'_c - 4000 \text{ psi}}{1000 \text{ psi}} = 0.80 \quad \phi := 0.90$$

$$b := 18 \text{ in} \quad d := 21 \text{ in} \quad A_s := 4A_{s9}$$

a) Use equivalent rectangular stress block

$$a := \frac{A_s \cdot f_y}{0.85 f'_c \cdot b} = 3.14 \text{ in} \quad M_{nr} := A_s \cdot f_y \cdot \left( d - \frac{a}{2} \right) = 389 \text{ ft} \cdot \text{kip}$$

b) Use a triangular stress block

$$a_t := \frac{A_s \cdot f_y}{f'_c \cdot \frac{b}{2}} = 5.33 \text{ in} \quad M_{nt} := A_s \cdot f_y \cdot \left( d - \frac{a_t}{3} \right) = 384 \text{ ft} \cdot \text{kip}$$

c) Use a parabolic stress block

$$a_p := \frac{A_s \cdot f_y}{\frac{2}{3} f'_c \cdot b} = 4.00 \text{ in} \quad M_{np} := A_s \cdot f_y \cdot \left( d - \frac{3}{8} \cdot a_p \right) = 390 \text{ ft} \cdot \text{kip}$$

d) Now look at the ratios

$$\frac{M_{nr}}{M_{nt}} = 1.01 \quad \frac{M_{nr}}{M_{np}} = 1.00$$

#### CONCLUSIONS

The selection of the shape of the compression block is not a critical parameter. All results are within the 4% margin of error associated with correlation to test results. The use of the rectangular stress block has been calibrated over a very large range of beams and columns and found to be adequate and a convenient method of computing flexural capacity.

$$3.14 \quad f'_c = 6000 \text{ psi}$$

$$f_y = 60,000 \text{ psi}$$

$$L = 30'$$

$$w_D = 0.475 \text{ kip/ft}$$

Effective width

$$M_L = \phi M_n - M_D = 895 \text{ ft-kips}$$

$$1.6 w_L \frac{L^2}{8} = M_L \quad w_L = \frac{8 M_L}{1.6 L^2} = \frac{8 (895)}{1.6 (30)^2} = 4.97 \text{ kip/ft}$$

$$\text{Posted Load} = \frac{w_L}{b} = \frac{4.97}{4} = 1.24 \text{ ksi} = \underline{\underline{1240 \text{ psf}}}$$

## Problem 3.15

A rectangular beam has a cross section 8 in. wide and an effective depth of 10 in. and a total depth of 12 in. is reinforced with a single fiberglass reinforcing bar that has a cross sectional area of 0.45 in.<sup>2</sup>. The bar has a nominal tensile strength of 140,000 psi, a linear stress strain curve to failure, and a strain at failure of 1.8%, and a modulus of elasticity of 7,800,000 psi. The concrete strength is  $f'_c = 6000$  psi. Determine the nominal capacity of the section.

## Given Data

$$b := 8 \text{ in} \quad h := 12 \text{ in} \quad d := 10 \text{ in} \quad f'_c := 6000 \text{ psi} \quad f_u := 140 \text{ ksi} \quad E_g := 7800000 \text{ psi}$$

$$\epsilon_u := 0.003 \quad \epsilon_{ug} := 0.018$$

$$\beta_1 := 0.75 \quad A_g := 0.45 \text{ in}^2$$

First Trial, assume that the fiberglass rod ruptures and the concrete fails in compression

$$T_n := f_u \cdot A_g \quad T_n = 63.0 \text{ kip}$$

$$a := \frac{T_n}{0.85 f'_c \cdot b} \quad a = 1.544 \text{ in} \quad c := \frac{a}{\beta_1} \quad M_n := T_n \cdot \left( d - \frac{a}{2} \right) = 581.4 \text{ in} \cdot \text{kip}$$

$$\epsilon_{g1} := \epsilon_u \cdot \frac{d - c}{c} \quad \epsilon_{g1} = 0.012 \quad \frac{\epsilon_{g1}}{\epsilon_{ug}} = 0.643$$

The strain in the glass is only 33% of the ultimate strain, therefore we do not have compatibility on the section and the fiberglass rod does not fail. We need to set up compatibility conditions and then solve for equilibrium.

By trial assume  $a := 1.268 \text{ in}$

$$c := \frac{a}{\beta_1}$$

$$\epsilon_{g1} := \epsilon_u \cdot \frac{d - c}{c}$$

$$T_g := E_g \cdot \epsilon_{g1} \cdot A_g$$

and iterate until the  $a_{\text{mod}} = a$ . When they are equal, we have compatibility, e.g., the location of the neutral axis results in a strain and corresponding force in the reinforcement to balance the compression force.

$$\epsilon_{g1} = 0.015$$

$$a_{\text{mod}} := \frac{T_g}{0.85 \cdot f_c \cdot b} \quad a_{\text{mod}} = 1.268 \text{ in}$$

Compute the nominal moment capacity using the usual equation except that  $A_s f_y$  is replaced by the tensile force  $T_g$ .

$$M_n := T_g \cdot \left( d - \frac{a}{2} \right) \quad M_n = 485 \text{ in} \cdot \text{kip}$$

The stress in the fiberglass rod is

$$f_g := E_g \cdot \epsilon_{gl} \quad f_g = 115 \text{ ksi}$$

$$\frac{f_g}{f_u} = 0.821$$

**COMMENT:**

The beam fails in concrete compression with the fiberglass reinforcement at only 82% of its ultimate tensile capacity. Using the nominal tensile capacity of the glass without adjusting for the modulus of elasticity leads to over prediction for the beam capacity.

Problem 3.16 compute the maximum and minimum reinforcement ratios for reinforcement with 80 ksi yield point and  $f'_c = 4000$  to 8000 psi in 1000 psi increments similar to those shown in table A.4a of Appendix A. Using the maximum and minimum reinforcement ratios, develop resistance factors and design graphs similar to Table A.5b and Graph A.1a

Solution: Assume maximum tensile strain in the steel is  $\epsilon_t = 0.005$

$$\textcircled{2} = 8 @ 8'' = 64''$$

$$\textcircled{2} = 4 @ 5\frac{1}{2}'' = 22''$$

$$\textcircled{3} = 6 @ 8'' = 48''$$

$$\underline{108''}$$

4.9

COMPRESSIVE FORCE  $N_u = 88 \text{ KIPS}$  ADDED TO PROBLEM 4.2

(a) MORE ACCURATE EQUATION:

$$M_m = M_u - N_u \left( \frac{4h-d}{8} \right) = 73.5 \times 12 - 88 \left( \frac{4 \times 20 - 17.5}{8} \right) = 195 \text{ KIPS}$$

$$\frac{V_u d}{M_m} = \frac{45.0 \times 17.5}{195} = 4.04$$

$$V_c = \left( 1.9 \sqrt{4000} + 2500 \times 0.0171 \times 4.04 \right) \frac{10 \times 17.5}{1800} \\ = 51.3 \text{ KIPS}$$

$$\text{LIMIT: } V_c \leq 3.5 \sqrt{f'_c} b_w d \sqrt{1 + \frac{N_u}{500 A_g}} \\ \leq 3.5 \frac{\sqrt{4000}}{1800} 10 \times 17.5 \sqrt{1 + \frac{88,000}{500 \times 10 \times 20}} = 53.1 \text{ KIPS}$$

(b) APPROXIMATE EQUATION:

$$V_c = 2 \left( 1 + \frac{N_u}{2000 A_g} \right) \sqrt{f'_c} b_w d, N_u \text{ in psi} \\ = 2 \left( 1 + \frac{88,000}{2000 \times 10 \times 20} \right) \sqrt{4000} \times \frac{10 \times 17.5}{1800} = 27.0 \text{ KIPS}$$

THE AXIAL FORCE REDUCES THE LENGTH OVER WHICH SHEAR REINFORCEMENT IS NEEDED -

$$\text{PREVIOUS } V_c \text{ (W/O AXIAL FORCE)} = 2 \sqrt{f'_c} b_w d \\ = \frac{2 \sqrt{4000} \times 10 \times 17.5}{1800} = 22.1 \text{ KIPS}$$

4.10

TENSION FORCE  $N_u = -44$  KIPS ADDED TO PROBLEM 4.2

(a) MORE ACCURATE EQUATION:

$$V_c = Z \left( 1 + \frac{N_u}{500 A_g} \right) \sqrt{f'_c} b_w d$$

WHERE  $N_u$  IS NEGATIVE FOR TENSION +  $\frac{N_u}{A_g}$  IS IN PSI

$$V_c = Z \left( 1 + \frac{-44,000}{500 \times 10 \times 20} \right) \frac{\sqrt{4000} \cdot 10 \times 17.5}{1000}$$
$$= 12.4 \text{ KIPS}$$

(b) APPROXIMATE APPROACH:

$$V_c = 0$$

WEB STEEL TAKES THE TOTAL  
SHEAR AS SUGGESTED IN ACI  
COMMENTARY R 11.2.2.3

4.11

REDDESIGN SHEAR REINFORCEMENT FOR BEAM IN  
PROBLEM 4.2 USING MCFT

$$d_v = 0.9d = 0.9 \times 17.5 = 15.75"$$

$$\text{CRITICAL SECTION @ } d_v = 15.75" = 1.31'$$

$$V_{u,d} = 55.8 - 7.44 \times 1.31 = 46.1 \text{ KIPS}$$

$$0.125 f'_c b_v d_v = \frac{0.125 \times 4000 \times 10 \times 15.75}{1000} = 78.8 \text{ KIPS}$$

THEREFORE,

$$S_{\max} \leq 0.8d_v = 12.6" \leftarrow \text{CONTROLS}$$

$$\leq 24"$$

$$\leq \frac{A_v f_{yt}}{\sqrt{f'_c} b_v} = \frac{0.22 \times 60,000}{\sqrt{4000} \times 10} = 20.9"$$

$$E_s = \frac{M_u / d_v + V_u}{E_s \times A_s} = \frac{M_u / 15.75 + V_u}{29,000 \times 3.00}$$

$M_u$  must be  $\geq V_u d_v$  in expression for  $E_s$

$$\beta = \frac{4.8}{1 + 750 E_s}$$

$$\ominus = 29 + 3500 E_s$$

$$V_c = \beta \sqrt{f'_c}$$

$$V_s = \frac{V_u - \phi V_c}{\phi}$$

(a)

$\phi = 0.9$  for shear

S.1

(a)

$$\begin{aligned} \text{CLEAR SPACING OF NO. 11} \\ &= 11.00 - 2(1.50 + 0.38 + 1.41) \\ &= 4.42" > 1.41" \end{aligned}$$

$$\begin{aligned} \text{CLEAR COVER OF NO. 11} \\ &= 1.50 + 0.38 = 1.88" > 1.41" \end{aligned}$$

+ STRUTS  $\geq$  MIN BY CODE

$$l_d = \left( \frac{f_y \psi_t \psi_e}{20 \lambda \sqrt{f'_c}} \right) d_b = \left( \frac{60,000 \times 1.3 \times 1}{20 \times 0.75 \sqrt{4000}} \right) 1.41 = 115"$$

BUT FOR  $w_u = 656 \text{ kips/ft}$ ;  $M_u = 210 \text{ ft-k}$ ;  $A_{s, \text{req'd}} = 2.45 \text{ in}^2$  VS  $A_{s, \text{provided}} = 3.12 \text{ in}^2$

$$\text{REDUCED } l_d = 115 \times \frac{2.45}{3.12} = 96", \text{ OK BY 3"}$$

(b) DISTANCE TO NEAREST FACE = 2.58"

$$\text{CENTERLINE SPACE} \times \frac{1}{2} = (4.42 + 1.41) \frac{1}{2} = 2.92"$$

$$\therefore c = 2.58"$$

$$K_{tr} = \frac{A_{tr}}{40 s_n} = \frac{0.22}{40 \times 10.5 \times 2} = 0.42; \frac{c + K_{tr}}{d_b} = 2.12$$

$$l_d = \left( \frac{3}{40} \frac{f_y}{\lambda \sqrt{f'_c}} \frac{\psi_t \psi_e \psi_s}{c + K_{tr}} \right) d_b = \frac{3 \times 60,000}{40 \times 0.75 \sqrt{4000}} \times \frac{1.3 \times 1 \times 1}{2.12} \times 1.41 = 82"$$

$$\text{REDUCED } l_d = 82 \times \frac{2.45}{3.12} = 64" - \text{SIGNIFICANTLY LESS -}$$

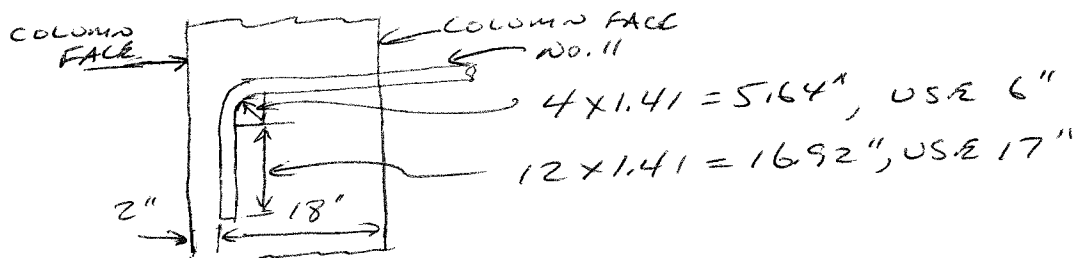

(c) FOR STRAIGHT BARS:  $l_d = 64 \frac{\sqrt{4000}}{\sqrt{5000}} = 57" > 18"$

$\therefore$  NEED HOOKS:

$$l_{dh} = \left( \frac{0.02 \psi_e f_y}{\lambda \sqrt{f'_c}} \right) d_b = \left( \frac{0.02 \times 1 \times 60,000}{1 \times \sqrt{5000}} \right) 1.41 = 24" > 18"$$

BUT CAN MODIFY

$$l_{dh} = 24 \times 0.7 \times \frac{2.45}{3.12} = 13" < 18" \text{ SO OK!}$$

5.2

$$W_u = 1.2 \times 1.05 + 1.6 \times 1.62 = 3.85 \text{ Kips/ft}$$

$$M_u = \frac{1}{8} \times 3.85 \times 27^2 = 351 \text{ K}$$

$$\frac{M_u}{\phi b d^2} = \frac{351 \times 12000}{0.9 \times 22 \times 16^2} = 831 \rightarrow \rho = 0.0155$$

$$\text{REQ'D } A_s = 5.46 \text{ in}^2$$

$$\text{PROV'D } A_s = 6.35 \text{ in}^2$$

$$\text{Three No. 10 : } A_s = 3.81 \text{ in}^2, \rho = 0.0108$$

$$(a) \frac{M_u}{\phi b d^2} = 599$$

$$M_u = \frac{599 \times 0.9 \times 22 \times 16^2}{12000} = 253 \text{ K}$$

$$\frac{253}{351} = 0.72$$

SO TWO NO. 10S COULD BE CUT

AT  $0.23 \times 27 = 6.21'$  FROM

SUPPORT  $\zeta$  (GRAPH A.2)

$$\text{ADD: } d = 1.33'$$

← CONTROLS

$$\text{OR } 12d_b = \frac{12 \times 1.27}{12} = 1.27'$$

$$\text{ACTUAL CUT POINT} = 6.21 - 1.33 = 4.88'$$

FROM SUPPORT  $\zeta$

(b) FOR NO. 10 BARS,  $l_d = 53''$  (TABLE A.10)

$$\text{FOR NO. 10 CUT BAR, REDUCED } l_d = 53 \frac{5.46}{6.35} = 46'' = 3.8'$$

$$\text{HAVE } (27 - 2 \times 4.88) / 2 = 8.62' > 3.8' \text{ OK}$$

FOR NO. 10 CONTINUOUS BARS, HAVE

$$6.21 \times 12 + 4 = 79'' - \text{NEED } 60'' \text{ OK}$$

$$(c) M_u = \frac{253}{0.9} = 281 \text{ KIPS}$$

$$V_u = \frac{1}{2} \times 3.85 \times 27.0 = 52.0 \text{ KIPS}$$

$$\therefore l_d \leq 1.3 \frac{281 \times 12}{52.0} + 4 = 88'', + l_d = 60''$$

SATISFIES THIS REQUIREMENT —

## 5.2 CONTINUED

(d)  $V_u$  @ THEORETICAL CUT POINTS

$$= 3.85 \times \frac{1}{2} \times 27.0 - 3.85 \times 4.88 = 33.2 \text{ KIPS}$$

$$\phi V_c = 0.75 \times 2 \sqrt{5000} \times \frac{22 \times 16}{1000} = 37.3 \text{ KIPS}$$

SINCE  $V_u > \frac{1}{2} \phi V_c$ , REQUIRED MINIMUM SHEAR

REINF. GIVES  $S \leq \frac{0.22 \times 60000}{0.75 \sqrt{5000} \times 22} = 11.3 \rightarrow 11 \text{ in.}$

$$S \leq \frac{0.22 \times 60000}{50 \times 22} = 12.0"$$

ALSO, MUST USE EXTRA NO. 3 L STIRRUPS OVER

$$\text{DISTANCE} = \frac{3}{4} \times 16 = 12" \text{ AT MAXIMUM SPACING}$$

$$\frac{d}{8\beta} = \frac{16}{8 \times 0.33} = 6" \text{ SAY 3 NO. 3 @ 6"}$$

(e)  $\frac{2 \text{ NO. 10 @ } 207"}{3 \text{ NO. 10 @ } 332"}$

$$\text{STEEL USED} = 1410"$$

$$\text{VS. } 5 \times 332 = 1660"$$

THIS SAVES 15% STEEL —

BUT HAVE LENGTHENED CALCULATIONS

CONSIDERABLY (COST \$ FOR REINFORCEMENT)

AND COMPLICATED STEEL PLACEMENT

IF ONLY ONE BEAM TO BE BUILT, CARRY ALL BARS THROUGH; IF MANY REPETITIONS, CUT TWO NO. 10

SEPARATE CALCULATIONS CORRESPONDING TO (b) + (c) INDICATE THAT THE REQUIRED  $l_d$  COULD NOT BE ACCOMMODATED  
THREE NO. 10 BARS WERE CUT —

### 5.3

#### SPLICE LENGTH

For bars of different size spliced in compression, the splice length is the larger of  $l_{dc}$  of the larger bar and the compression lap length of the smaller bar - per ACI Code 12.6.2.

$l_{dc}$  for No. 10 bars:

$$l_{dc} = \left( \frac{0.02 f_y}{\lambda \sqrt{f_c}} \right) d_b = \left( \frac{0.02 \times 75000}{1.0 \sqrt{8000}} \right) 1.27 = 21"$$

$$l_{dc} = 0.0003 f_y d_b = 0.0003 \times 75000 \times 1.27 = 29" \leftarrow \text{controls}$$

Applying the reduction factors for steel area and spiral reinforcement:

$$l_{dc} = 29 \times \frac{5.80}{7.59} \times 0.75 = 16.6" \geq 12"$$

lap length for No. 9 bars ( $f_y > 60,000 \text{ psi}$ )

$$\begin{aligned} \text{lap} &= (0.0009 f_y - 24) d_b \\ &= (0.0009 \times 75000 - 24) 1.128 = 49" \end{aligned}$$

Applying the reduction for spiral reinforcement,

$$49 \times 0.75 = 36.75"$$

USE 37" LAP

5.4

FOR NO. 8 BARS:

$$\text{CLEAR SPACE} = (10 - 4 - 3) \frac{1}{2} = 1.5" > d_b$$

$$\text{CLEAR COVER} = 2" > d_b$$

ASSUME NO. 3 STIRRUPS -

$$\therefore \text{FROM TABLE A.10, } l_d/d_b = 62$$

$$l_d = 62 \times 1 = 62"$$

BUT WE HAVE ONLY  $40 - 2 = 38"$

SO WE NEED TO USE A 90° HOOK

FOR HOOKED BARS:

$$l_{dL} = \left( \frac{0.02A}{\lambda \sqrt{f_c}} \right) d_b = \left( \frac{0.02 \times 1}{1 \times \sqrt{4000}} \right) 1 = 19"$$

NO MODIFICATION FACTOR -  $19" < 38"$  OK!

BUT WE ALSO NEED TRANSVERSE STEEL ACCORDING TO ACI -

$$\text{MAX SPACING} = 3 \times 1.0 = 3"$$

OVER DISTANCE  $l_{dL} = 19"$ , USE 6 NO. 3 @ 3"

CHECK VERTICAL CLEARANCE:

$$2 + \frac{3}{8} + 4 + 12 + 2 = 20 \frac{3}{8}" < 20 \frac{1}{2}"$$

5.5

ASSUME NO. 8 BARS ARE FULLY STRESSED

BY APPROX. EQ. (5.5a)

$$\text{CLEAR COVER} = 3.5" > d_b$$

$$\text{CLEAR SPACING} = 15" > 2d_b$$

$$\text{CLASS B SPACE} = 1.3 \times 78 = 101"$$

SPECIAL ANCHORAGE SHOULD NOT BE NEEDED  
IF MINIMUM STIRRUPS PROVIDED -

6.1  
(a)

$$\begin{aligned} b &= 12'' \\ d &= 20.5'' \\ h &= 23'' \\ l &= 18.5' \\ A_s &= 2.40 \text{ in}^2 \end{aligned}$$

$$\rho = \frac{A_s}{bd} = \frac{2.40}{12 \times 20.5} = 0.0078$$

$$E_s = 29 \times 10^3 \text{ ksi}$$

$$E_c = 57 \sqrt{4000} = 3.6 \times 10^3 \text{ ksi}$$

$$n = 8$$

$$K = \sqrt{(\rho n)^2 + 2\rho n} - \rho n = 0.296$$

$$j = 1 - K/3 = 0.901$$

$$\text{AT SERVICE LOAD } W_s = 3.37 \text{ kips/ft}$$

$$M_s = 3.37 \times \frac{18.5^2}{8} = 144 \text{ kips}$$

$$f_s = \frac{M}{A_s j d} = \frac{144 \times 12}{2.40 \times 0.901 \times 20.5} = 39.0 \text{ ksi}$$

$$k_d = 0.296 \times 20.5 = 6.07''$$

$$h_2 = 23 - 6.07 = 16.93''$$

$$h_1 = 16.93 - 2.5 = 14.43''$$

$$\beta = \frac{h_2}{h_1} = 1.17 \quad A = \frac{5 \times 15}{4} = 18.75$$

$$w = 0.076 \times 1.17 \times 39.0 \sqrt[3]{2.5 \times 18.75} = 12.5 \text{ OR } 0.0125''$$

(b)

CLEAR SPACING = 2.5"

SPACING = 3.5"

$$\text{Eq. (6.3)} : S = 15 \left( \frac{40000}{f_s} \right) - 2.5$$

$$= 15 \left( \frac{40000}{39000} \right) - 2.5 \times 10 = 10.4''$$

$$> 3.5'' \quad \text{OK}$$

6.2

$$A_s = 2 \times 1.00 = 2.00 \text{ in}^2$$

$$\rho = \frac{2.00}{15 \times 20.5} = 0.0065$$

$$n = 8$$

$$k = 0.275$$

$$j = 0.9083$$

$$f_s = \frac{144 \times 12}{2.00 \times 0.9083 \times 20.5} = 46.4 \text{ ksi}$$

$$s = 15 \left( \frac{40000}{46400} \right) - 2.5 \times 2 = 7.93''$$

$$\text{Spacing} = 15 - 4 - 1.128 = 9.87'' > 7.93''$$

NO GOOD

Because  $s$  is greater than the allowable spacing, at least three bars are needed. Three No. 8 (No. 25) Grade 60 bars would cut the spacing and provide nearly the same steel area (2.37 vs 2.40) as the four No. 7 (No. 22) bars without requiring the use of higher strength steel.

6.3

$$b = 15" \quad w_o + w_d = 1.08 \text{ K/ft}$$

$$d = 20.5" \quad w_l = 2.29 \text{ K/ft}$$

$$h = 23" \quad k = 0.296$$

$$A_s = 240 \text{ in}^2 \quad k_d = 6.07"$$

$$n = 8 \quad j = 0.901$$

$$f_y = 60 \text{ KSI}$$

$$f'_c = 4 \text{ KSI}$$

$$f_r = 7.5 \sqrt{f'_c} = 474 \text{ psi}$$

$$M_d = 1.08 \times 18.5^2 / 8 = 46.2 \text{ KIPS}$$

$$M_{d+l} = 3.37 \times 18.5^2 / 8 = 144.2 \text{ KIPS}$$

$$I_g = \frac{1}{12} \times 12 \times 23^3 = 12200 \text{ in}^4$$

$$I_{CT} = \frac{1}{3} \times 12 \times 6.07^3 + 25.28 \times 14.43^2 = 5278 \text{ in}^4$$

$$M_{cr} = \frac{0.474 \times 12200}{11.5 \times 12} = 41.9 \text{ KIPS}$$

(a) For  $w_o + w_d$ :

$$\left( \frac{M_{cr}}{M_d} \right)^3 = \left( \frac{41.9}{46.2} \right)^3 = 0.746$$

$$I_e = (0.746 \times 12200) + (0.254 \times 5278) = 10442 \text{ in}^4$$

$$\Delta_{i,d} = \frac{5}{384} \frac{w_l l^4}{E_c I_e} = \frac{5 \times 1.27 (18.5 \times 12)^4}{384 \times 3.6 \times 10^3 \times 10442 \times 12} = 0.08"$$

For  $w_o + w_d + w_l$ :

$$\left( \frac{M_{cr}}{M_a} \right)^3 = \left( \frac{41.9}{144.2} \right)^3 = 0.025$$

$$I_e = (0.025 \times 12200) + (0.975 \times 5278) = 5451 \text{ in}^4$$

$$\Delta_{i,d+l} = \frac{5 \times 3.37 (18.5 \times 12)^4}{384 \times 3.6 \times 10^3 \times 5451 \times 12} = 0.45"$$

$$\text{Thus, } \Delta_{i,l} = 0.45 - 0.08 = 0.37"$$

(b) With  $A_s' = 0$ ,  $\lambda_e = 2.0 @ 54.5$  -

$$\Delta_{cr} + \Delta_{i,l} = 0.08 \times 2 + 0.37 = 0.53"$$

(c) By ACI (Table 6.2)

$$\Delta \leq \frac{18.5 \times 12}{480} = 0.46"$$

SO BEAM DOES NOT QUITE SATISFY REQUIREMENTS -

ALSO, WE WOULD PROBABLY BE APPLIED EARLY SO THAT  $\Delta_d$  SHOULD BE BASED ON  $I_e = 5451$  RATHER THAN 10442.

6.4

$$= 0.17"$$

THE TOTAL DEFLECTION

= 0.65". THIS EXCEEDS

THE ACI 2/480 REQUIREMENT -

THE EARLY APPLICATION

OF FULL LINE LOAD

INCREASED CRACKING +

DECREASED THE STIFFNESS

FOR ALL SUBSEQUENT

LOADS

# 6.6 SAME BEAM AS PROBLEM 6.5

(a) SAME AS 6.5(b);  $\Delta_i = 0.073''$  UNDER DL ONLY

(b)  $W = W_d + 0.20 W_e = 1.36 \text{ Kips/ft}$        $M^- = 82.3' \text{-KIPS}$   
 $M^+ = 46.2' \text{-KIPS}$

MIDSPAN:  $I_g = 8873 \text{ in}^4$      $I_{CT} = 3342$      $M_{cr} = 35.6' \text{-KIPS}$

$$I_e = \left( \frac{35.6}{46.2} \right)^3 8873 + \left[ 1 - \left( \frac{35.6}{46.2} \right)^3 \right] 3342 = 5877 \text{ in}^4$$

SUPPORT:  $I_g = 8875 \text{ in}^4$      $I_{CT} = 5334$      $M_{cr} = 35.6' \text{-KIPS}$

$$I_e = \left( \frac{35.6}{82.3} \right)^3 8873 + \left[ 1 - \left( \frac{35.6}{82.3} \right)^3 \right] 5334 = 5620 \text{ in}^4$$

$$\text{AVG. } I_e = \frac{1}{2} (5877 + 5620) = 5748$$

$$\Delta_{i, \text{sus}} = \frac{1.36 (22 \times 12)^4}{185 \times 4030 \times 5748 \times 12} = 0.113''$$

$$\Delta_{cr} = 2.0 \times 0.13 = 0.26''$$

$$(\Delta_i + \Delta_{cr})_{\text{sus}} = 0.39''$$

(c) WITH FULL DL+LL IN PLACE,  $I_{\text{AVG}}$  IS THE SAME AS FOR PROBLEM 6.5b;  $I_{\text{AVG}} = 4501$

$$\text{THEN } \Delta_{i, \text{DL+LL}} = \frac{2.8 \times (22 \times 12)^4}{185 \times 4030 \times 4501 \times 12} = 0.34''$$

AND FOR LAST 0.8xLL:

$$\Delta_L = 0.14 \text{ x LL} = \Delta_{i, \text{DL+0.2LL}} = 0.34 - 0.13 = 0.21''$$

SO LATER APPLICATION OF FULL LL HAS

(1) REDUCED TOTAL DEFLECTION DUE TO SUSTAINED LOAD FROM 0.48'' TO 0.39''

(2) INCREASED DEFL. DUE TO SHORT-TERM PART OF LL FROM 0.17'' TO 0.21''

MAXIMUM DEFLECTION HAS DECREASED FROM 0.65'' TO 0.60''

$$2A_t = 0.0210 \left(1 - \frac{x}{15}\right)$$

FROM SUPPORT TO MIDSPAN -

FINISH AS IN PROBLEM

7.1 -

Case 1

Case 2

Case 1

$$R_L = R_R = 80 + 1.1 \times 18 = 99.8 \text{ kips}$$

$$T_L = T_R = 160 \text{ ft-kips}$$

$$V_u \text{ @ } d \text{ from face of support} = 99.8 - 1.1 \times \frac{29}{2} = 97.1 \text{ kips}$$

Case 2 (+3)

$$R_L = \frac{83 \times 24^2}{36^3} (3 \times 12 + 24)$$

$$+ \frac{22 \times 12^2}{36^3} (3 \times 24 + 12) + \frac{1.1 \times 36}{2} = 87 \text{ kips}$$

$$R_R = 83 + 22 + 1.1 \times 36 - 87 = 57.6 \text{ kips}$$

Torsion: 53 ft-kips will be symmetrical. The balance (160 - 53 = 107 ft-kips) will be split based on stiffness - 2/3 to left + 1/3 to right support.

$$T_L = 53 + \frac{2}{3} \times 107 = 124.3 \text{ ft-kips}$$

$T_R = 88.7 \text{ ft-kips}$ . Case 3 is the mirror image -

Case 1 will control outer 1/3's of girder, Case 2 will control middle 1/3.

$$A_{cp} = 28 \times 32 + 24 \times 6 = 1040 \text{ in}^2$$

$$p_{cp} = 2 \times 32 + 2 \times 28 + 2 \times 24 = 168 \text{ in}$$

$$\phi \lambda \sqrt{f'_c} \left( \frac{A_{cp}^2}{p_{cp}} \right) = 0.75 \times \sqrt{4800} \times \left( \frac{1040^2}{168} \right) = 305,400 \text{ in-kips} = 25.45 \text{ ft-kips} < T_u$$

∴ Must consider torsion

$$\phi 4 \lambda \sqrt{f'_c} \left( \frac{A_{cp}^2}{p_{cp}} \right) = 101.8 \text{ ft-kips} < T_{u \max}$$

∴ Can design for this lower torque because structure is statically indeterminate -

Max torque in middle 12'

$$= 101.8 - 53 = 48.8 \text{ ft-kips}$$

Case 1

Case 2 (assumed)

$$b_w d = 28 \times 29 = 812 \text{ in}^2$$

$$x_o = 28 - 2 \times 1.5 - 0.5 = 24.5 \text{ in}$$

$$y_o = 32 - 2 \times 1.5 - 0.5 = 28.5 \text{ in}$$

$$A_o h = 245 \times 28.5 = 698 \text{ in}^2$$

$$A_o = 0.85 A_o h = 593 \text{ in}^2$$

$$P = 0$$

$$M_o = 0.85 \times 5 \times 2.98 \times 16(8 - \frac{2.98}{2}) + 4.5(17.11 - 0.85 \times 5) \times 5 + 4.5 \times 60 \times 5 = 2959''\text{-k} = 247''\text{-k}$$

SMALLER C  $\rightarrow$  TRY C = 5.6" ①

$$a = 4.48''$$

$$E_{s'} = 0.00139 \quad f_s' = 40.3 \text{ ksi}$$

$$E_s = 0.00396 \quad f_s = 60 \text{ ksi}$$

$$P_m = 0.85 \times 5 \times 4.48 \times 16 + 4.5(40.3 - 0.85 \times 5) \times 5 - 4.5 \times 60 = 197 \text{ kips}$$

$$M_m = 0.85 \times 5 \times 4.48 \times 16(8 - \frac{4.48}{2}) + 4.5(40.3 - 0.85 \times 5) \times 5 + 4.5 \times 60 \times 5 = 3916''\text{-kips} = 326''\text{-kips}$$

LARGER C  $\rightarrow$  TRY C = 14.4 ②

$$a = 11.52''$$

$$E_{s'} = 0.00238 \quad f_s' = 60 \text{ ksi}$$

$$E_s = 0.00029 \quad f_s = 8.4 \text{ ksi} \quad \text{COMPRESSION}$$

$$P_m = 0.85 \times 5 \times 11.52 \times 16 + 4.5(60 - 0.85 \times 5) + 4.5(8.4 - 0.85 \times 5) = 1053 \text{ kips}$$

$$M_m = 0.85 \times 5 \times 11.52 \times 16(8 - \frac{11.52}{2}) + 4.5(60 - 0.85 \times 5) \times 5 - 4.5(8.4 - 0.85 \times 5) \times 5 = 2916''\text{-k} = 243''\text{-k}$$

8.2

$$P_o = 0.85 \times 8(16^2 - 9) + 9 \times 60 \\ = 2220 \text{ kips}$$

Compared to problem 8.1, this represents  $\frac{2220 - 1590}{1590} \times 100 = 39.6\%$  greater axial load capacity -

Using point 1 from Problem 8.1,  $C = 5.6 \text{ in}$ ,  $a = 3.64 \text{ in}$ ,  $f_s + f_s'$  are as shown in Problem 8.1 -

$$P_m = 0.85 \times 8 \times 3.64 \times 16 \\ + 4.5(40.3 - 0.85 \times 8) - 4.5 \times 60 = 277 \text{ kips} \\ \frac{277 - 197}{197} \times 100 = 40\% \text{ increase}$$

$$M_m = 0.85 \times 8 \times 3.64 \times 16 \left(8 - \frac{3.64}{2}\right) \\ + 4.5(40.3 - 0.85 \times 8) \times 5 + 4.5 \times 60 \times 5 \\ = 4049 \text{ in-kips} = 337 \text{ ft-kips} \\ \frac{337 - 326}{326} \times 100 = 3.4\%$$

$f'_c$  is not recommended for higher floors because increase in flexural capacity is minimal.  $f'_c = 8000 \text{ psi}$  is justified only where higher axial load capacity is needed.

9.6 CONTINUING THE CALCULATIONS FROM PROBLEM 9.5,

COLS BZ, DZ + CZ

$$I = 0.70 \times 24 \times 24^3 / 12 = 19,354 \text{ in}^4; I_{lc} = \frac{19354}{16 \times 12} = 101$$

COLS AZ + EZ

$$I = 0.70 \times 20 \times 20^3 / 12 = 9333 \text{ in}^4; I_{lc} = \frac{9333}{16 \times 12} = 49$$

GIRDERS

$$I_{lc} = 101 + 49 = 150$$

9.7 RESOLVE EXAMPLE 9.2 WITH  $l_c = 16'$ ,  $l_u = 15'$  AND LATERAL STORY DEFLECTION = 1.10"

$$V_{us} = 1.6 \times 55 = 88 \text{ kips}$$

$$\Delta_o = 1.6 \times 1.10 = 1.76"$$

$$\text{COLS A3+F3 } P_u = 228 \text{ kips}$$

$$\text{B3, C3, D3, F3 } P_u = 449 \text{ kips}$$

$$\Sigma P_u = 2 \times 228 + 4 \times 449 = 2252 \text{ kips}$$

$$Q = \frac{\Sigma P_u \Delta_o}{V_{us} l_c} = \frac{2252 \times 1.76}{88 \times 16 \times 12} = 0.235$$

$Q > 0.05 \rightarrow$  SWAY FRAME ANALYSIS REQUIRED

GRAVITY PLUS WIND LOADS

$$S_s M_{25} = \frac{M_{25}}{1-Q} = \frac{134}{1-0.235} = 1751 \text{ kips}$$

$$M_2 = 110 + 175 = 2851 \text{ kips}$$

$$K_m = \frac{P_u}{\phi F_c A_g} = \frac{459}{0.65 \times 4 \times 324} = 0.545$$

$$R_m = \frac{M_u}{\phi F_c A_g l_u} = \frac{285}{0.65 \times 4 \times 324 \times 18} = 0.226$$

USING GRAPH A.6 ( $\gamma = 0.7$ ),  $\rho_g = 0.042$

$$A_{st} = 0.042 \times 324 = 13.61 \text{ in}^2$$

USE 4 NO. 11 + 8 NO. 9 BARS, GIVING 14.24 in<sup>2</sup>

REQUIRES NO. 4 TIES  $\{ 5 \leq 18", 48 \times 0.5 = 24", 16 \times 1.28 = 18" \} @ 18"$

9.8

$$V_u = 1.6 \times 110 = 176 \text{ Kips}$$

$$\Delta_o = 1.6 \times 0.40 = 0.64 \text{ in.}$$

15 more wind loads to calc.  $\Sigma P_u$  for story

$$A1+F1 \quad P_u = 1.2 \times 495 + 1.0 \times 99 = 693 \text{ Kips}$$

$$B1+E1 \quad P_u = 1.2 \times 1090 + 1.0 \times 206 = 1514$$

$$C1+D1 \quad P_u = 1.2 \times 989 + 1.0 \times 188 = 1375$$

$$\Sigma P_u = 2 (693 + 1514 + 1375) = 7164 \text{ Kips}$$

$$Q = \frac{\Sigma P_u \Delta_o}{V_{us} L_c} = \frac{7164 \times 0.64}{176 \times 22.25 \times 12} = 0.098$$

$Q > 0.05 \rightarrow$  Sway frame analysis as required

Gravity loads only on B1+E1

$$P_u = 1.2 \times 1090 + 1.6 \times 206 = 1638 \text{ Kips}$$

$$M_u = 1.2 \times 4 + 1.6 \times 70 = 117 \text{ ft-Kips}$$

$$\frac{K L_u}{r} = 1.0 \times 22 \times 12 / 0.3 \times 26 = 33$$

$$34 - 12 \frac{m_1}{m_2} = 34 - 12 \frac{1.2(-2) + 1.6(-35)}{1.2(4) + 1.6(70)} = 40 > \frac{K L_u}{r}$$

Therefore, slenderness need not be checked -

$$K_u = \frac{P_u}{\phi F_y A_g} = \frac{1638}{0.65 \times 4 \times 676} = 0.932$$

$$R_u = \frac{M_u}{\phi F_y A_g h} = \frac{117 \times 12}{0.65 \times 4 \times 676 \times 26} = 0.0307$$

Assume  $\gamma = 0.8$

From Graph A.7,  $\rho_s = 0.022$

$$A_{st} = 0.022 \times 676 = 14.87, \text{ use 12 No. 10 } A_{st} = 15.24$$

Gravity plus wind loads - By inspection, slenderness must be considered since  $\frac{K L_u}{r} > 22$ .

$$\delta_s = \frac{1}{1-Q} = \frac{1}{1-0.098} = 1.109; M_s = 1.6 \times 240 = 384 \text{ ft-Kips}$$

$$M_{us} = 1.2 \times 4 + 1.0 \times 70 = 75 \text{ ft-Kips}$$

## 9.8 Continued

$$M_2 = 75 + 426 = 501 \text{ ft-kips}$$

$$P_u = 1.2 \times 1090 + 1.0 \times 206 + 1.6 \times 19 = 1544 \text{ kips}$$

$$K_m = \frac{1544}{0.65 \times 4 \times 676} = 0.879; R_m = \frac{501 \times 2}{0.65 \times 4 \times 676 \times 26} = 0.132$$

From Graph A.7,  $\phi_s = 0.028$

$$A_{st} = 0.028 \times 676 = 18.93 \text{ in.}^2$$

Use 12 No. 11,  $A_{st} = 18.72 \text{ in.}^2$  or 4 No. 14 + 8 No. 10,  $A_{st} = 19.16 \text{ in.}^2$

Use No. 4 ties [spacing  $\leq 26 \text{ in.}$ ,  $\leq 48 \times 0.5 = 24$ ,  
 $\leq 16 \times 1.41 = 22.5$ ] use 22 in.

$$\frac{26 - 4 - 3 \times 1.41}{3} = 5.92 < 6 \text{ in.} - \text{OK}$$

Single cross tie required  
in each direction

$$10.1 \quad f'_c = 5000 \text{ psi}, f_y = 60,000 \text{ psi}$$

$$R_B = 1600 \left( \frac{24}{36} \right) = 1067 \text{ k}$$

$$R_C = 1600 \frac{12}{36} = 533 \text{ k}$$

Check section shear capacity.

$$\begin{aligned} V_{\max} &= \phi 10 \sqrt{f'_c} b d \\ &= 0.75(10) \frac{\sqrt{5000}}{1000} 24 \cdot 120 \\ &= 1527 \text{ k} > R_B = 1067 \text{ k} \quad \text{OK} \end{aligned}$$

Node stress limits

$$\text{CCC Node} \quad \beta_n = 1$$

$$\begin{aligned} \phi f_{cu} &= \phi \cdot 0.85 \beta_n f'_c \\ &= 0.75(0.85)(1) \frac{5000}{1000} \\ &= 3.19 \text{ ksi} \end{aligned}$$

$$\text{CCT node} \quad \beta_n = 0.80$$

$$\begin{aligned} \phi f_{cu} &= 0.75(0.85)(0.80) 5.0 \\ &= 2.55 \text{ ksi} \end{aligned}$$

Bottle shaped strut capacity  
 $\rho_s = 0.75$

$$\begin{aligned} \phi f_{cu} &= \phi \beta_s \cdot 0.85 f'_c \\ &= 0.75(0.75)(0.85) 5.0 \\ &= 2.39 \text{ ksi} \end{aligned}$$

Size struts using bottle-shaped strut limit, The width are:

$$w_{AB} = \frac{F_{AB}}{\phi f_{cu} b} = \frac{1670}{2.39(24)} = 29.1 \text{ in}$$

$$w_{AC} = \frac{1390}{2.39(24)} = 24.2 \text{ in}$$

$$w_{BC} = \frac{1280}{2.39(24)} = 22.3 \text{ in}$$

Validate assumed structural depth

$$d = 144'' - \frac{22.4}{3} - \frac{22.3}{2} = 125 \text{ in}$$

h      node A      w<sub>BC</sub>

$d > 120 \text{ in}$  assumed OK.

STRUCTURE

STRUT & TIE MODEL

Geometry

$$\theta_1 = \tan^{-1} \frac{10}{12} = 39.8^\circ$$

$$\theta_2 = \tan^{-1} \frac{10}{24} = 22.6^\circ$$

FORCES

$$F_{AB} = \frac{1067}{\sin 39.8} = 1670 \text{ k}$$

$$F_{AC} = \frac{533}{\sin 22.6} = 1390 \text{ k}$$

$$F_{BC} = \frac{1067}{\tan 39.8} = 1280 \text{ k}$$

Partial Node A

(Cont.)

## 10.1 (Cont.)

Check stress at column connections (Node ends are OK since  $\phi \beta_n 0.85 f'_c < \phi \beta_n .85 f'_c$ )

At node A  $p = \frac{1600^k}{24 \times 24} = 2.78 \text{ ksi} < \phi \beta_n .85 f'_c$  for C-C-C node OK

At node B.  $p = \frac{1067}{24 \times 24} = 1.85 \text{ ksi} < \phi \beta_n .85 f'_c$  for C-C-T node OK

By inspection Node C is OK

Design Tension tie

$$A_s = \frac{F_{Tc}}{\phi f_y} = \frac{1280^k}{0.75(60)} = 28.4 \text{ in}^2$$

Try 23 #10 = 29.2 in<sup>2</sup>  
(#32)

Check shear capacity

$$A_v = 0.0025 b_s = 0.0025(24)(12) = 0.72 \text{ in}^2/\text{ft} \quad \text{Use } \#5(\#16) @ 10 \text{ in}$$

$$A_h = 0.0015 b_s = 0.0015(24)(12) = 0.43 \text{ in}^2/\text{ft} \quad \text{Use } \#4(\#13) @ 10 \text{ in each face}$$

Verify placement with 5 #10 (#32) per row.

$$t_{\min} = 1.5 \times 2 + 2(1.62 + .5) + 5(1.27) + 4(2.5) = 21.6 \text{ in} < 24 \text{ in avail OK}$$

$\uparrow$  cover       $\uparrow$  #5 + #4       $\uparrow$  #10       $\uparrow$  2d<sub>b</sub> clear spacing

Check height

$$h = 2(1.5 + .62) + 5(1.27) + 4(2.5) = 20.6 \text{ in} < w_{oc} = 22.3 \text{ in} \quad \text{OK}$$

$\uparrow$  cover       $\uparrow$  #5 stirrup       $\uparrow$  d<sub>b</sub>       $\uparrow$  2d<sub>b</sub> spacing  
 distance above = cover below

Use mechanical anchors or 90° hooks.

10.2  $f'_c = 5000 \text{ psi}$ ,  $f_y = 60,000 \text{ psi}$

Possible strut-and-tie-models. (a) is simplest & developed

$f'_c = 5000 \text{ psi}$ ,  $f_y = 60,000 \text{ psi}$

$$\sum M_c = 0 = 22.4(16) + 112(8) - V_A(11)$$

$$V_A = 114 \text{ k}$$

$$\sum F_x = 0 = H_c - 22.4 \text{ k} \quad H_c = 22.4 \text{ k} \leftarrow$$

$$\sum F_y = 0 = -V_A - 112 + V_c \quad V_c = 226 \text{ k}$$

$$\theta_1 = \tan^{-1} \frac{11}{15} = 36.3^\circ$$

$$\theta_2 = \tan^{-1} \frac{8}{15} = 28.1^\circ$$

Solve truss forces

$$F_{AC} = \frac{114}{\cos \theta_1} = 141.5 \text{ k}$$

$$F_{BC} = \frac{112}{\cos \theta_2} = 127 \text{ k}$$

$$F_{ab} = 141.5 \cdot \sin \theta_1 = 83.8 \text{ k}$$

Determine strut capacity for bottle shaped strut  $\beta_s = 0.75$

$$\phi \beta_s 0.85 f'_c = 0.75(0.75)(0.85)(5.0) = 2.39 \text{ ksi}$$

Using a pressure of 2.39 ksi provides the following strut widths

$$w_{AC} = \frac{F_{AC}}{\phi \beta_s} = \frac{141.5}{2.39(12)} = 4.93"$$

$$w_{BC} = \frac{127}{2.39(12)} = 4.43"$$

$$w_{ab} = \frac{83.8}{2.39(12)} = 2.92"$$

$$\text{Available height} = 18" - \frac{4.93 \cos \theta_1}{3} - 1" = 15.7" > 15" \text{ assumed OK}$$

$$\text{Design tie } A_s = \frac{F_{ab}}{\phi f_y} = \frac{83.8}{0.75(60 \text{ ksi})} = 1.86 \text{ in}^2$$

Use 3 #7 (#22) = 1.80 in<sup>2</sup> and pick up difference in shear reinforcement. Use a 90° hook on left end. (Cont.)

Model Geometry

STRUCTURAL Model  
Assume truss height = 15" & Overall height 18"

## 10.2 (Cont.)

Check shear for bottle shaped struts

$$A_v = 0.0025 d \cdot b = .0025(18) 12 = 0.54 \text{ in}^2/\text{ft} \quad \text{- carry in main column reinforcement}$$

$$A_h = 0.0015 d \cdot b = .0015(18) 12 = 0.32 \text{ in}^2/\text{ft}$$

Use #4(#13) at 15" - 2#4(#13) in bracket

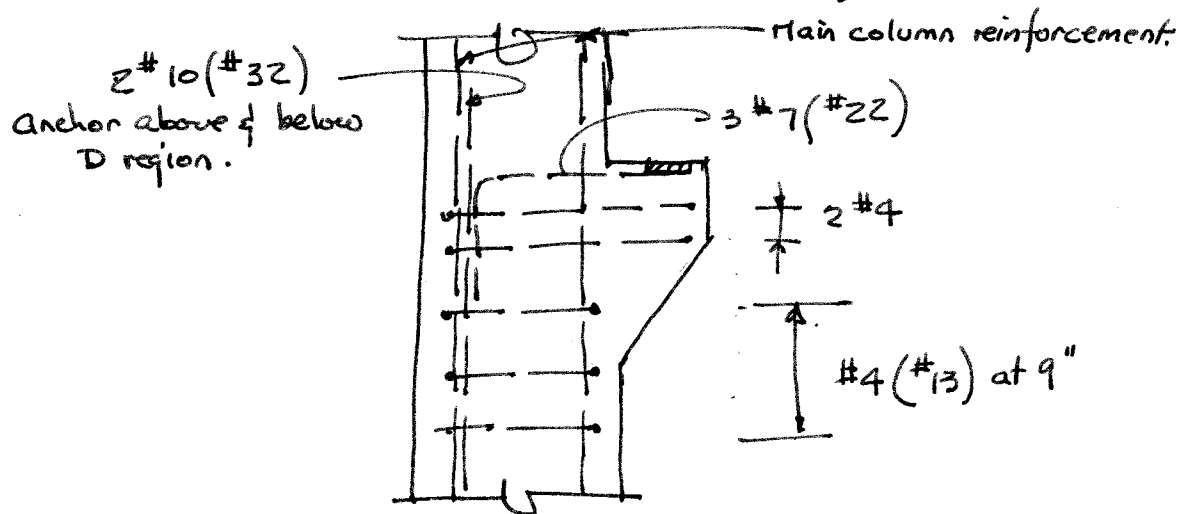

Check tensile reinforcement in column from reaction at A

$$A_s = \frac{V_u}{\phi f_y} = \frac{114}{.75(60)} = 2.53 \text{ in}^2 \quad 2\#10(\#32) = 2.54 \text{ in}^2$$

IF column reinforcement is in compression - check capacity  
IF column reinforcement is in tension - add  $2.24 \text{ in}^2$  and anchor above level of bracket.

Check horizontal thrust at C

$H_c = 22.4 \text{ k}$  this equates to a strut with a width of 0.78 in and a tie having an area of  $0.24 \text{ in}^2$ . #4(#13) ties at 9" satisfy this requirement

10.3  $f'_c = 6000 \text{ psi}$   $b = 6''$   
 $f_y = 60,000 \text{ psi}$

$V_u = 82^k$

$H_u = 18^k$

TRUSS MODEL  
 ESTIMATE STRUCTURAL DEPTH = 21"

STRUCTURAL MODELS

$$\theta_1 = \tan^{-1} \frac{21}{10.5} = 63.4^\circ$$

$$F_{AB} = \frac{82}{\sin \theta_1} = 91.68$$

$$F_{BE} = 91.68 \cos \theta_1 = 41.0^k$$

$$F_{AC} = F_{AB} \cos \theta_1 + 18 = 91.68 \cos 63.4 + 18 = 59^k$$

$$F_{BC} = 82^k = F_{BD}$$

$$F_{DF} = 82^k$$

Set node and strut width for bottle shaped struts

$$p = \phi \phi_s 0.85 f'_c = 0.75(0.75)(0.85)(6) = 2.87 \text{ ksi}$$

$$w_{ab} = \frac{F_{ab}}{p b} = \frac{91.7}{2.87(6)} = 5.32 \text{ in}$$

$$w_{BE} = \frac{41}{2.87(6)} = 2.38 \text{ in}$$

Check height assumption

$$h = 24'' - \frac{2.38}{2} - 1'' = 21.8'' > 21'' \text{ assumed ok continue design}$$

(strut BE) ← horiz. steel

Design Bearing plate

$$l = \frac{V_u}{p b} = \frac{82}{2.87(6)} = 4.76 \text{ in} \quad 3 \text{ in provided}$$

Increase bearing plate to 5 inches wide x 6 in.

Design Bearing plate anchor

$$A_s = \frac{F_{AC}}{\phi f_y} = \frac{59^k}{0.75(60)} = 1.31 \text{ in}^2$$

$$\text{Use } 2 \#8 (\#25) \quad A_s = 1.58 \text{ in}^2$$

(Cont.)

### 10.3 (Cont)

Complete bearing plate design  
To Anchor strut AB use an angle  
with a height  $h_1 > W_{AB} \cos \theta_1$

$$> 5.32 \cos 63.4 = 2.35 \text{ - Say } 2\frac{1}{2}''$$

Alternatively use headed studs ( $f_y = 50 \text{ ksi}$ ) + shear friction

$$A_v = \frac{V_u}{\phi f_y u} = \frac{91.7 \cos 63.4}{0.75(50)(0.7)} = 1.56 \text{ in}^2$$

↑  
conc on steel

Use 4 #6 (#19) headed studs  $A_v = 1.76 \text{ in}^2$

Design ties for  $F_{BD}$

$$A_s = \frac{F_{BD}}{\phi f_y} = \frac{82}{.75(60)} = 1.82 \text{ in}^2 \quad \text{use 6 \#5 (\#16)} \quad A_s = 1.86 \text{ in}^2$$

$$W_{BD} = \frac{F_{BD}}{p b} = \frac{82}{2.87(6)} = 4.76 \text{ in} \quad \text{Spacing} = 2 \text{ in}$$

Check tensile requirements at DF

$$A_s = \frac{F_{DF}}{\phi f_y} = \frac{82}{.75(60)} = 1.82 \text{ in}^2 \quad \text{- Say } 2\#9 (\#29) \text{ with mechanical anchors}$$

10.4  $f'_c = 5000 \text{ psi}$   $f_y = 60,000 \text{ psi}$

use  $b = 16 \text{ in}$

$w_d = 1.2 w_g = 1.2 (11 \times \frac{16}{12} \times 0.15) = 2.64 \text{ klf}$

$w_s = 3.80 \text{ klf}$

$w_{total} = 6.44 \text{ klf}$

Apply distributed loads as concentrated loads 2'-c-c. Increase 1st load 50% to account for end effect.

$P_{typ} = 6.44 \text{ klf} \times 2 = 12.88 \text{ k}$

$P_1 = 12.88 \times 1.5 = 19.32 \text{ k}$

Assume effective depth  $= 0.8h = 8.8'$

Assume bottle shaped struts,  $\beta_s = 0.75$ , which is more critical than a c-c-t rate  $\beta_n = 0.80$ . Use  $\beta_s$  to size struts.

$\phi = \phi \beta_s 0.85 f'_c = 0.75 (0.75) 0.85 (5.0) = 2.39 \text{ ksi}$

Strut Geometry & Loads

FG	$38.7^\circ$	$1600 \text{ k}$	$41.9''$	$1250 \text{ k}$
				$\Sigma = 1291 \text{ k}$

Design Tension Tie

$A_s = \frac{F_{FG}}{\phi f_y} = \frac{1291}{0.75(60)} = 28.7 \text{ in}^2$

$23 \#10 (\#32) = 29.2 \text{ in}^2$

$19 \#11 (\#36) = 29.6 \text{ in}^2 \leftarrow \text{USE}$   
 & check spacing.

check shear

$A_v = 0.0025 bs = .0025 (16) 12 = 0.48 \text{ in}^2/\text{ft} \rightarrow \#4 (\#13) \text{ at } 10'' = 0.48 \text{ in}^2/\text{ft}$

$A_h = 0.0015 bs = .0015 (16) 12 = 0.29 \text{ in}^2/\text{ft} \rightarrow \#4 (\#13) \text{ at } 16'' = 0.30 \text{ in}^2/\text{ft}$

(Cont.)

10.4 (Cont.)

Check spacing for 3 #11 (#36) per row

$$b = (1.5 + 0.5)2 + 3(1.56) + 2(2 \times 1.56) = 14.92" < 16"$$

Cover + #4 - both sides 3 bars  $2d_b$  clear

16" width is OK

Number of layers  $n = \frac{19}{3} = 7$  6 layers of 3 + 1 of 1 bar.

$$\text{Vertical requirement} = \underbrace{1\frac{1}{2}}_{\text{cover \#4}} + \underbrace{\frac{1}{2}}_{\text{\#11}} + 7(1.56) + 2(2 \times 1.56) = 31.6 \text{ in}$$

$2d_b$  spacing

$$w_{FG} = 41.9" > \text{requirement} \therefore \text{width is sufficient}$$

END Anchorage - Hooks or mechanical anchors are needed. If hooks are used there must be 31.6" beyond the node to separate the hooks by  $2d_b$ , or else use mechanical anchors

Comments.

Since struts can not cross, there is no design for loads inside the main (1000k) truss. A 12.9k load requires  $A_s = \frac{12.9}{0.75(60)} = 0.29 \text{ in}^2$ .

This is about half the minimum shear reinforcement, so placing loads on the bottom flange does not provide additional safety.

The 1000k column is given as 14" x 14" for a CCC node

$$\phi \phi_n (0.85 f_c') = 0.75 (1) \cdot 85 (5) = 3.19 \text{ ksi the width of}$$

the column must be:  $w = \frac{1000}{3.12 (16)} = 20.03$ . Hence the column should be 16 x 20 to meet code requirements

# Problem 10.5

1/2

**Problem 10.5** A column transfers a factored load of 700 kips to a 9-ft square footing shown in Figure P10.5, resulting in a factored uniform soil pressure of 8640 psf. Design the footing reinforcement using strut-and-tie methods. Material strengths are  $f'_c = 4000$  psi and  $f_y = 60,000$  psi. Because footings typically contain no shear reinforcement, your design should be based on unreinforced bottle shaped struts.

## Strut and Tie data

$\beta_n = 0.8$  C-C-T Node  
 $\beta_s = 0.6$  Bottle shaped strut with no shear reinforcement  
 $\phi = 0.75$   
width= 102 in

## Material Data

$f'_c = 4000$  psi  
 $f_y = 60$  ksi

Strut strength =  $0.85 f'_c \times \beta_s \times \phi$

$f_{ns} = 1530$  psi

Loads =  $q \times$  tributary area

$P_1 = 103.5$  kip 4 Locations  
 $P_0 = 90.6$  kip 2 Locations

## Geometry

	h	b	L

$n = 6.87$  #8

$A_s = 5.53$  in<sup>2</sup>

## DESIGN

**Use 7- #8 at 12 in each way Hook bars at end for anchorage**

Problem 10.5  
2/2

Figure P10.5

Strut-and-tie model

**Problem 10.6** Redesign the footing in problem 10.5 using traditional flexure and shear methods as described in Chapter 16. Compare your solution to Problem 10.5 and comment on your results.

$$f'_c := 4000 \text{ psi}$$

$$f_y := 60000 \text{ psi}$$

$$q_u := 8640 \frac{\text{lbf}}{\text{ft}^2}$$

$$w_c := 150 \cdot \frac{\text{lbf}}{\text{ft}^3}$$

$$P_u := 750 \cdot \text{kip}$$

$$b := 9 \text{ ft}$$

$$h := 36 \text{ in}$$

$$\phi_s := 0.75$$

$$\phi_f := 0.90$$

$$\phi_b := 0.65$$

$$t := 30 \cdot \text{in}$$

## METHODOLOGY

1. Soil bearing is provided so no check of WSD is needed and step 1 is omitted.
2. Check punching shear. This check often sets the thickness of the footing.
3. Check slab shear.
4. Design flexural reinforcement.
5. Check bond and development length.
6. Check bearing stress under the column, especially if the column concrete strength is greater than the footing concrete strength.
7. Check temperature and minimum steel requirements and sketch final design.

### 2. Check Punching (two-way) Shear

$$d := h - 4.0 \text{ in} = 32 \text{ in}$$

4" difference between  $h$  and  $d$  reflects 3" cover and 1 to center of bars in two layers.  $H$  is less than the 36" originally used for weight so the bearing stress is OK.

$$b_o := 4 \cdot (d + t)$$

$$b_o = 248 \text{ in}$$

$$v_c := 4 \sqrt{f'_c} \cdot \text{psi}$$

$$v_c = 253 \text{ psi}$$

$$A_v := b_o \cdot d$$

$$A_v = 7936 \text{ in}^2$$

$$\phi V_n := \phi_s \cdot v_c \cdot A_v$$

$$\phi V_n = 1506 \text{ kip}$$

$\phi V_n > V_u = P_u$ , therefore the design is OK.

**Step 3 Check One-Way Shear along the face of the footing**

$$w := \frac{b}{2} - d - \frac{t}{2}$$

$$w = 0.58 \text{ ft}$$

$$V_u := q_u \cdot w \cdot b$$

$$V_u = 45 \text{ kip}$$

$$\phi V_c := 2\phi_s \cdot \sqrt{f'_c} \cdot \text{psi} \cdot b \cdot d$$

$$\phi V_c = 328 \text{ kip}$$

Nominal shear capacity exceeds the ultimate load, therefore, one way shear is OK

**Step 4 Flexural Design**

While the shear may be computed at a location  $d$  from the face of the column, the flexural design must be computed at the face of the column.

$$l := \frac{b}{2} - \frac{t}{2} = 3.25 \text{ ft}$$

$$M_u := \frac{q_u \cdot l^2}{2} = 548 \text{ in} \cdot \frac{\text{kip}}{\text{ft}}$$

$$\text{try } a := 2 \text{ in}$$

$$A_s := \frac{M_u}{\phi_f f_y \left( d - \frac{a}{2} \right)} = 0.327 \frac{\text{in}^2}{\text{ft}}$$

$$A_{s8} := 0.79 \text{ in}^2$$

$$\text{Spacing of \#8 } s := \frac{A_{s8}}{A_s} \cdot 12 \cdot \frac{\text{in}}{\text{ft}} = 29.0 \text{ in}$$

$$\text{Try \#8 @ 14 in. } A_s \text{ provided} = 0.68 \text{ in}^2/\text{ft}$$

Check "a"

$$\frac{0.68 \cdot \text{in}^2 \cdot f_y}{.85 \cdot f'_c \cdot 12 \cdot \text{in}} = 1.00 \text{ in} < a \text{ assumed, OK}$$

The estimate for "a" could be refined, but as will be seen later, the refinement is not necessary at this time.

**Step 5 Check Bond and Development**

The development length must be less than the portion of the slab extending beyond the face of the column.

$$\text{\#8 bottom bar from table A.10, } l_d/d_b = 38$$

$$d_b := 1.0 \text{ in}$$

$$\text{cover} := 3 \cdot \text{in}$$

$$l_d := 38 \cdot d_b$$

$$l_d = 38 \text{ in}$$

$$> \frac{b}{2} - \frac{t}{2} - \text{cover} = 36 \text{ in}$$

Therefore the development length requires hooks for anchorage

**Step 6 Check Column Bearing Stress on Footing**

If the column and footing do not have the same strength, an additional check is needed. It is not required for this problem.

**Step 7 Check temperature and minimum reinforcement**

$$A_{st} := 0.0018 \cdot h \quad A_{st} = 0.778 \frac{1}{ft} in^2$$

Temperature reinforcement is less than provided, therefore OK

$$A_{smin} := 0.0033d \quad A_{smin} = 1.267 \frac{1}{ft} in^2$$

Minimum reinforcement is greater than provided. Increase reinforcement to #8 @ 10 in  $A_s = 0.94 in^2/ft$ . Since  $A_s$  provided is greater than  $A_s$  required, the development length can be adjusted by 10/14 and the hooks are not required.

**Final Detailing**

Note: The footing is also influenced by the anchorage of the column reinforcement. The depth must be at least  $l_{dc}$ . Furthermore, if the column has bending, hooks may be required for the anchorage of the tensile steel.

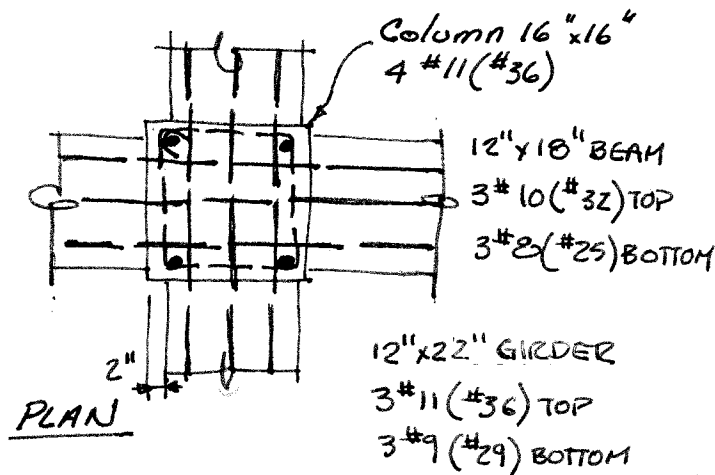

The strut-and-tie solution requires #8 at 12 in versus #8 at 14 inches prior to the correction for temperature. In addition, the strut-and-tie solution requires hooked bars where the traditional solution does not. Otherwise, the solutions are extremely similar.

# 11.1 INTERIOR JOINT

CARRY ALL BEAM AND GIRDER BARS THROUGH THE JOINT  
THIS SATISFIES DEVELOPMENT REQUIREMENTS FOR BOTH TOP  
AND BOTTOM BARS

CHECK CLEARANCES

PASS TOP STEEL FROM GIRDER  
UNDER TOP STEEL FROM BEAM

## CHECK BAR SPACING

$$X = 16" - 3" \text{ COVER} - 2(1.41) - 1" \text{ STIRRUP} = 9.18 \text{ in}$$

$$\text{LESS } 3 \#11 (\#39) = \frac{4.23}{9.95}$$

$$\text{CLEAR SPACING} = 4.95/2 = 2.47 \text{ in} = 1.75 d_b \text{ OK}$$

## CHECK CONFINEMENT

$$\text{BEAM WIDTH} = \text{GIRDER WIDTH} = 12 \text{ in}$$

$$3/4 \text{ COL WIDTH} = 3/4 \times 16 = 12 \text{ in} \text{ SO OK}$$

$$\text{ALSO EXPOSED CONCRETE} = (16 - 12)/2 = 2 \text{ in} < 4 \text{ in OK}$$

$\therefore$  NO TRANSVERSE REINFORCEMENT IN JOINT

ALTHOUGH PART OF PRIMARY LATERAL LOAD SYSTEM, THE NET  
MOMENT, WHEN COMBINED WITH DL+LL GRAVITY MOMENTS  
WOULD BE  $M_2 < M_1$ , AND WOULD HAVE A SMALL SHEAR. BY  
ACI 352 RECOMMENDATION  $M_2 = M_1 = A_s f_y (d - a/2)$  RESULTING  
IN NO SHEAR.

## 11.2 EXTERIOR JOINT

VERTICAL & HORIZONTAL CLEARANCE  
OK AS CONFIRMED IN PROB 11.1

CHECK JOINT CLASSIFICATION FOR SHEAR.

$$\frac{3}{4} \times 16" = 12" = \text{GIRDER WIDTH}$$

$$\frac{3}{4} \times 22" \text{ depth} = 16.5", \text{ BEAM DEPTH} = 18" > 16.5"$$

SO JOINT IS "EXTERIOR" AND  $\gamma = 20$

GIRDER MOMENTS BALANCE SO SHEAR IS  
IN "BEAM" DIRECTION ONLY WITH EFFECTIVE  
JOINT WIDTH  $b_j = \frac{b_b + b_c}{2} = \frac{16 + 12}{2} = 14 \text{ in.}$

$$V_N = \gamma \sqrt{f'_c} b_j h = 20 \sqrt{4000} \frac{14 \times 18}{1000} = 319 \text{ k}$$

$$a = \frac{A_s f_y}{0.85 f'_c b} = \frac{3(1.27)60}{0.85(4)(12)} = 5.60 \text{ in}$$

$$M_n = 3(1.27)60(15.5 - \frac{5.6}{2}) \frac{1}{12} = 242 \text{ ft-kip}$$

COLUMN HEIGHT NOT GIVEN. ASSUME  $l_1 = 12'$

$$V_{col} = \frac{M_n}{l_1} = \frac{242}{12} = 20.2 \text{ k} \quad T_u = A_s f_y = 3(1.27)60 = 229 \text{ k}$$

$$\text{IN JOINT } V_u = T_u - V_{col} = 229 - 20.2 = 208 \text{ k}$$

$$\phi V_n = 0.75(319) = 239 \text{ k} > V_u \quad \underline{\text{OK}}$$

CHECK CONFINEMENT IN "GIRDER" DIRECTION

$$\frac{3}{4}(16) = 12" = \text{GIRDER WIDTH, AND}$$

$$\text{EXPOSED COLUMN FACE} = (16 - 12)/2 = 2" < 4" \quad \text{— ALL OK}$$

BUT IN "BEAM" DIRECTION - MUST PROVIDE CONFINEMENT STEEL.  
PROVIDE 2 LAYERS #4 (#13) TIES BETWEEN TOP & BOTTOM  
BARS - (TENTATIVE - SEE FINAL BELOW).

CHECK BEAM BAR ANCHORAGE

$$\#10(\#32) \text{ BARS CRITICAL } L_{hb} = \frac{1200 d_b}{\sqrt{f'_c}} = \frac{1200(1.27)}{\sqrt{4000}} = 24.1"$$

USE MODIFICATION FACTOR = 0.7 DUE TO COLUMN SIDE COVER

$$L_h = 24.1(0.7) = 16.9" > \text{COLUMN.}$$

USE TIES ALONG FULL DEVELOPMENT LENGTH AT  $S = 3d_b$

$$3(1.27) = 3.81" \text{ — USE } 3.5" \text{ THEN}$$

$$L_h = 24.1(0.7)(0.8) = 13.5" \text{ also } > 8d_b = 10.2" > 6" \quad \left. \vphantom{L_h} \right\} \text{OK}$$

(CON'T.)

## 11.2 (CON'T.)

CHECK AVAILABLE SPACE =  $16 - 1\frac{1}{2} \text{ COVER} - \frac{1}{2} t_{ic} = 14" > 13.5" \text{ OK}$

TIES FOR  $l_h = 13.5 \text{ in}$   $n = \frac{13.5}{3.5} = 3.8$  USE 4 #4 (#13) VERTICAL

TIES ALONG DEVELOPMENT LENGTH

BUT VERTICAL TIE WOULD INTERFERE WITH CONCRETE PLACEMENT. ACI CODE ALLOWS VERTICAL OR HORIZONTAL TIES, SO PLACE TIE HORIZONTALLY IN THE 11.59 IN CLEAR BETWEEN TOP & BOTTOM BARS

### 11.3 THERE ARE TWO SOLUTIONS - SHEAR FRICTION & STRUT-TIE

#### SHEAR FRICTION SOLUTION

$$f'_c = 6000 \text{ psi} \quad f_y = 60,000 \text{ psi} \quad b = 20$$

$$V_u = 1.2(45) + 1.6(36) = 111.6 \text{ k}$$

$$N_{uc} = 0.2 V_u = 0.2(111.6) = 22.3 \text{ k}$$

$$V_n \leq \begin{cases} 0.2 f'_c b d = 1200 b d \\ 800 b d \leftarrow \end{cases}$$

$$V_u = \phi V_n \quad 111.6 = 0.75(.80)(20)d \\ d = 9.3"$$

BUT ALSO

$$d \geq \frac{1}{2}(9+y-1) \quad d \geq 8"$$

and  $h = 17"$  WITH  $d = 16" \leftarrow \text{USE}$

#### SHEAR FRICTION

$$A_{vf} = \frac{V_u}{\phi \mu f_y} = \frac{111.6}{0.75(1.4)60} = 1.77 \text{ in}^2$$

$$M_u = V_u a + N_{uc}(h-d) = 111.6(4) + 22.3(1) = 692 \text{ in-k}$$

$$A_f = \frac{M_u}{\phi f_y (d - \frac{a}{2})} \quad \text{ESTIMATE } a = 1"$$

$$= \frac{692}{0.75(60)(16 - \frac{1}{2})} = 0.99 \text{ in}^2 \quad \text{CHECK } a = \frac{0.99(60)}{.85(6)(20)} = 0.58 \text{ in}$$

RESIZE WITH  $a = 0.6$

$$A_f = \frac{692}{0.75(60)(16 - \frac{.6}{2})} = 0.98 \text{ in}^2 \quad \text{OK}$$

$$A_h = \frac{N_{uc}}{\phi f_y} = \frac{22.3}{0.75(60)} = 0.50 \text{ in}^2$$

$$A_s = A_f + A_h = 0.98 + 0.50 = 1.48 \text{ in}^2$$

AND

$$A_s = \frac{2}{3} A_{vf} + A_h = \frac{2}{3}(1.77) + 0.5 = 1.68 \text{ in}^2 \leftarrow \text{USE}$$

$$\text{CHECK } A_{s, \min} = 0.04 \frac{f'_c}{f_y} b d = 0.04 \left( \frac{6}{60} \right) 20(16) = 1.28 \text{ in}^2$$

$$\text{USE } 3 \#7 (\#22) = 1.80 \text{ in}^2$$

#### HOOP STEEL

$$A_h = 0.5 A_f = 0.5(1.98) = 0.49 \text{ in}^2$$

$$A_h = \frac{1}{3} A_{vf} = \frac{1.77}{3} = 0.59 \text{ in}^2 \leftarrow \text{USE}$$

$$\text{USE } 2 \#4 (\#13) \square \quad A_h = 2(2)(0.2) = 0.80 \text{ in}^2$$

hoop legs

#### SHEAR-FRICTION SOLUTION

### 11.3 (CON'T.) - STRUT & TIE SOLUTION

$$\sum M_B = 0 = T_U h - V_U (6 + 2.5) - N_{UC} (17)$$

$$T_U = \frac{111.6(8.5) + 22.3(17)}{15} = 88.5 \text{ k}$$

$$\theta = \tan^{-1} \frac{8.5}{15} = 29.5^\circ$$

$$F_U = \frac{T_U}{\sin \theta} = \frac{88.5}{\sin(29.5)} = 180 \text{ k}$$

$$C_U = T_U = 88.5 \text{ k}$$

STRUT CAPACITY  $\phi_s = 0.75$

$$f_{os} = \phi_s 0.85 f'_c = .75(.75)(85)(6) = 2.87 \text{ ksi}$$

$$w_s = \frac{F_U}{f_{os} b} = \frac{180}{2.87(20)} = 3.14 \text{ in}$$

COMPRESSION STRUT

$$w_c = \frac{C_U}{f_{os} b} = \frac{88.5}{2.87(20)} = 1.54 \text{ in}$$

CHECK TRUSS MODEL

$$h = 16 - 1 - \frac{1.54}{2} = 14.2 \text{ in} < 15 \text{ " REVISE}$$

$$\theta = \tan^{-1} \frac{8.5}{14} = 31.3^\circ$$

$$F_U = \frac{88.5}{\sin 31.3} = 170.3$$

$$w_s = \frac{170.3}{2.87(20)} = 2.97 \text{ " OK - FITS UNDER ANGLE}$$

$$w_c = \frac{88.5}{2.87(20)} = 1.54 \quad h = 16 - 1 - \frac{1.54}{2} = 14.2 > 15 \text{ " OK}$$

TENSION TIE

$$A_s = \frac{T_U}{\phi f_y} = \frac{88.5}{.75(60)} = 1.97 \text{ in}^2 \quad \text{USE } 3 \# 8 (\# 25) = 2.37 \text{ in}^2$$

SHEAR

$$A_v = 0.0025 b_s = .0025(20) \times \text{WIDTH OF BRACKET} = 0.45 \text{ in}^2 \quad 2 \# 5 (\# 16) = 0.62 \text{ in}^2$$

$$A_h = .0015 b_s = .0015(20)(12) = 0.36 \text{ in}^2 \quad \# 4 (\# 13) \text{ AT } 12 \text{ in}$$

11.4 SOLUTION BY STRUT & TIE MODEL  
 $f'_c = 5000 \text{ psi}$ ,  $f_y = 60,000 \text{ psi}$

$$V_u = 1.2D + 1.6L$$

$$= 1.2(0.085)8\left(\frac{30}{2}\right) + 1.6(0.090)8\left(\frac{30}{2}\right) = 21.8 \text{ k}$$

NODE CAPACITY  $\beta_n = 0.80$

$$f_{un} = \phi \beta_n (.85 f'_c) = .75(.8)(.85)5 = 2.55 \text{ ksi}$$

BOTTLE STRUT CAPACITY  $\beta_s = 0.75$

$$f_{us} = \phi \beta_s (.85 f'_c) = 0.75(0.75)(.85)5 = 2.39 \text{ ksi}$$

PRESSURE UNDER BEARING PLATE

$$P = \frac{V_u}{A_b} = \frac{21.8}{4 \times 6} = 0.91 \text{ ksi} < f_{un} \text{ ok USE } p \text{ for strut}$$

$$\theta = \tan^{-1} \frac{8}{9} = 41.6^\circ$$

$$F_u = \frac{V_u}{\cos \theta} = \frac{21.8}{\cos 41.6} = 29.2 \text{ k}$$

$$\text{STRUT WIDTH} = \frac{F_u}{P b} = \frac{29.2}{.91(6)} = 5.3''$$

$$T_u = C_u = F_u \sin \theta = 29.2 \sin 41.6 = 19.4 \text{ k}$$

$$w_c = \frac{19.4}{0.91(6)} = 3.5 \text{ in}$$

$$h_{AVAIL} = 12 - 1 - 3.5/2 = 9.2 \text{ in} > 9'' \text{ Assumed OK}$$

TENSION TIE

$$A_s = \frac{T_u}{\phi f_y} = \frac{19.4}{0.5(60)} = 0.43 \text{ in}^2 \quad \underline{\text{USE 2\#5 (\#16)}} \quad A_s = 0.62 \text{ in}^2$$

STIRRUT

$$A_v = \frac{V_u}{\phi f_y} = \frac{21.8}{0.75(60)} = 0.48 \text{ in}^2 \quad \underline{\text{USE 2\#5 (\#16) AT EA. PLATE}} \quad A_v = 0.62 \text{ in}^2$$

ANCHOR STUDS ON PLATE - BY SHEAR FRICTION,  $f_f = 90 \text{ ksi}$

$$A_{sv} = \frac{C_u}{\phi \mu f} = \frac{19.4}{0.75(0.70)60} = 0.74 \text{ in}^2$$

USE 4-#4 (#13) HEADED STUDS X 5" LONG (TO GO THRU STRUT)

Assume  $b = 6''$

## 12.2 MOMENT REDISTRIBUTION IN BEAMS

$$A_s^+ = 2.45 \text{ in}^2 \quad A_s^- = 2.88 \text{ in}^2$$

- a) DRAW ELASTIC MOMENT DIAGRAM TO SEE WHICH SECTION, IF ANY, WILL YIELD AND ROTATE. COMPUTE  $M_n$  FOR EACH SECTION AND COMPARE THIS TO THE ELASTIC MOMENT DIAGRAM.

FIND  $M_n$ ;  $T = C \quad A_s f_y = .85 f_c' a b$

$$a = 4.23 \text{ in.}$$

$$M_n = A_s f_y (d - \frac{a}{2}) = 2.88 \times 60 (24 - \frac{4.23}{2}) = 315 \text{ FT-K}$$

FIND  $M_n^+$ ;  $a = 2.45 \times 60 / (.85 \times 4 \times 12) = 3.6 \text{ in.}$

$$M_n^+ = 272 \text{ FT-KIPS.}$$

HOW COMPARE THESE TO ELASTIC MOMENT DIA;

$$P = 63.3 / 90 = 70.3 \text{ KIPS.}$$

$$M_A = 3PL / 16 = 310 \text{ FT KIPS} \approx 315 \text{ OK}$$

$$M_B = 5PL / 32 = 264 \text{ FT KIPS} < 272 \text{ OK.}$$

NEITHER SECTION WILL FORM A PLASTIC HINGE AND REQUIRE ROTATION CAPACITY BECAUSE OF MOMENT REDISTRIBUTION.

- b)  $A_s^-$  REDUCED BY 12.5%

FIND NEW  $M_n$ ;

$$A_s^- = 2.88 (1 - 0.125) = 2.52 \text{ in}^2$$

$$a = 3.71 \text{ in.}$$

$$M_n = A_s f_y (d - \frac{a}{2}) = 279 \text{ FT KIPS.}$$

$M_n^+$  CAN THEN BE FOUND BY CONSTRUCTING A STATICALLY CONSISTANT MOMENT DIAGRAM.

$$PL/4 = 421.8 \text{ K}; M_n = 421.8 - 140 = 281.8$$

$$\phi M_n / bd^2 = 441 \text{ PSI} \quad \rho = 0.0084$$

$$A_s^+ \cdot \rho bd = 0.0084 \times 12 \times 24 = 2.56 \text{ in}^2$$

SO  $A_s^-$  IS APPROX EQUAL TO  $A_s^+$ .

ROTATION REQUIREMENT AT LEFT SUPPORT.

(MOMENT AREA METHOD)

$$t_{CA} = \sum A_i \bar{x} \text{ ABOUT } C.$$

$$= 422 \times 12 \times 12 - 279 \times \frac{1}{2} \times 24 \times \frac{2}{3} \times 24 = 7200 / EI.$$

CALCULATE  $I_{CB}$ .  $A_s \approx A_s^+ \approx 2.56 \text{ in}^2$

$$\rho = A_s / bd = 2.56 / (12 \times 24) = 0.00889.$$

$$C = 7.54 \text{ in.}$$

$$I_{CB} = \frac{1}{3} (12 \times 7.54^3 + 20.5 \times 16.5^2) = 7296 \text{ in}^4$$

SO,  $t_{CA} = 0.474 \text{ in.}$  AND

$$\theta_A = t_{CA} / L = 0.00164 \text{ RADIANS.}$$

(CONJUGATE BEAM METHOD)

$$\sum M_L = 0 = \theta_A 24 + \frac{1}{EI} \left[ \frac{1}{2} \times 279 \times 24 \times 16 - 422 \times 12 \times 12 \right]$$

$$\theta_A = 300 / EI = \left[ \frac{300}{3.6 \times 10^3 \times 7296} \right] \times \left( \frac{12}{1} \right)^2 = 0.00164.$$

- c) 25% REDUCTION.

FIND NEW  $M_n$ .

$$A_s^- = 2.88 (1 - 0.25) = 2.16 \text{ in}^2$$

$$a = 3.18 \text{ in} \quad M_n = 242 \text{ FT KIPS.}$$

$$M_n^+ = 422 - 121 = 301 \text{ FT KIPS.}$$

$$A_s^+ = 0. \quad \phi M_n / bd^2 = 470. \quad \rho = 0.0095$$

$$A_s^+ = 2.75 \text{ in}^2 \text{ THIS MUST BE ACCOUNTED}$$

FOR IN & RECALCULATED  $I_{CB}$ .

$$A_{s \text{ AVG}} = \frac{18(2.75) + 6(2.16)}{24} = 2.60 \text{ in}^2.$$

$$\rho = 0.0090 \text{ AND } C = 7.54 \text{ in.}$$

" USE SAME  $I_{CB} = 7296 \text{ in}^4$ .

$$t_{CA} = 14304 / EI = 0.94 \text{ in.}$$

$$\theta_A = 0.00327 \text{ RADIANS.}$$

ROTATION CAPACITIES

$$\phi_Y = \frac{\epsilon_Y}{4(1-k)} \quad \phi_Y' = \frac{M_n}{M_Y} \phi_Y \quad \phi_u = \frac{\epsilon_{cu}}{C}$$

$$\theta_p = (\phi_u - \phi_Y') l_p \quad l_p = 0.5d + 0.05z.$$

$$\epsilon_Y = \frac{f_y}{E} = 0.0021$$

## 12.2 (CONT)

FOR PART (a) THERE IS NO ROTATION REQD. THE SECTION IS REINFORCED FOR THE ELASTIC MOMENT DIAG, AND THEORETICALLY BOTH THE SUPPORT AND CENTER SECTIONS WOULD YIELD SIMULTANEOUSLY.

FOR PART (b) ROTATION REQMT = 0.0016 RAD.

$$\phi_Y = 0.0021 / 24(1 - 0.34) = 0.00013 / \text{IN}$$

$$M_Y = 2.52 \times 60 \times (24 - \frac{7.54}{3}) = 271 \text{ FT KIPS.}$$

$$\phi'_Y = [271 / 271] \times 0.00013 = 0.00013 / \text{IN.}$$

$$\epsilon_{cu} = 0.003 + 0.02 b \frac{V}{M} + 0.20 \rho''$$

$$V = 46.8 \text{ K} \quad M = 271 \text{ FT KIPS.}$$

$$\rho'' = \text{D TOTAL STIRRUP LENGTH IS } 2$$

$$2 \times (24 - 2 - 1.5) + 2(12 - 3) = 59 \text{ IN.}$$

$$\#3 \square @ 9 \text{ IN. } A_s = 0.11 \text{ IN}^2$$

$$\rho'' = 0.11 \times 59 / 9 \times 12 \times 24 = 0.0025.$$

$$\epsilon_{cu} = 0.003 + 0.02 \times 12 \times (46.8 / 3348) + 0.20 \times 0.0025$$

$$= 0.00685.$$

$$\text{HINGING LENGTH } l_p = 0.5 \times 24 + 0.05 \times 6 \times 12 = 15.6 \text{ IN.}$$

$$\phi_u = \epsilon_{cu} / c = 0.00685 / 4.4 = 0.0015.$$

$$\theta_p = (\phi_u - \phi'_Y) l_p = (0.0015 - 0.00013) \times 15.6$$

$$\theta_p = 0.021 \text{ RAD.}$$

FOR PART (c) ROTATION REQMT IS 0.00327 RAD.

$$\phi_Y = 0.0021 / 24(1 - 0.24) = 0.00012 / \text{IN}$$

$$M_Y = 234 \text{ FT KIPS.}$$

$$\phi'_Y = 0.00012 \text{ RAD/IN}$$

$$\rho'' = \text{SAME } \epsilon_{cu} = 0.00688.$$

$$\phi_u = 0.00688 / 3.74 = 0.0018$$

$$l_p = 15.18 \text{ IN.}$$

$$\theta_p = 0.0255 \text{ RAD.}$$

## ACI MOMENT REDISTRIBUTION

M - MAY BE

DECREASED BY 1000  $\epsilon_t$  % -

FOR PART (b)  $A_s = 2.52 \text{ in}^2$

$$c = \frac{1}{0.85} \frac{2.52 \times 60}{0.85 \times 4 \times 12} = 4.36''$$

$$\epsilon_t = \frac{0.003(24 - 4.36)}{4.36} = 0.0135$$

→ % REDISTRIBUTION = 13.5%

$$M_{red} = 315 \times 0.865 = 272 \text{ FT KIPS}$$

FOR PART (c)  $A_s = 2.16 \text{ in}^2$

$$c = \frac{2.16}{2.52} \times 4.36 = 3.74''$$

$$\epsilon_t = \frac{0.003(24 - 3.74)}{3.74} = 0.016$$

→ % REDISTRIBUTION = 16%

$$M_{red} = 315 \times 0.84 = 265 \text{ FT KIPS}$$

## COMMENTS: ACI PROVIDES A LESS

TIME CONSUMING METHOD THAT YIELDS

GOOD RESULTS. IF, HOWEVER, MORE

REDUCTION IS REQUIRED THAN ALLOWED

BY ACI, THE THOROUGH ANALYSIS IS

NECESSARY.

## 12.3 MOMENT REDISTRIBUTION

a)  $w = 0.9 \times 1.2 + 1.4 \times 1.6 = 3.32 \text{ KIPS/FT.}$

$$M_1^- = \frac{1}{10} \times 3.32 \times 25^2 = 207.5 \text{ FT-KIPS}$$

$$M_2^+ = \frac{1}{14} \times 3.32 \times 25^2 = 148.2 \text{ FT-KIPS}$$

$$M_3^+ = \frac{1}{16} \times 3.32 \times 25^2 = 129.7 \text{ FT-KIPS}$$

BASED ON  $b_w = 12"$ ,  $h = 24"$

b) ELASTIC FRAME.

THE MINIMUM CHANGE IS 10% →

MOMENTS AT FACE OF SUPPORT — USE  $V_u L/2$  + DON'T CHANGE +VE MOM. —  
 USE  $V_u = 3.32 \times 25/2 = 41.5$ , SAY 45 KIPS —

1)  $M = 193 - (45 \times 1.5/2) = 159 \text{ FT}$

2)  $M = 150 - (45 \times 1.5/2) = 116 \text{ FT-KIPS}$

## SECTION DESIGN

①  $A_s = 1.89 \text{ in}^2$

②  $A_s = 1.39 \text{ in}^2$

③  $A_s = 1.20 \text{ in}^2$  (T-SECTION)

## 12.4

### RESULTS FROM ELASTIC FRAME ANALYSIS BY COMPUTER:

CASE A: DL+LL ON BOTH SPANS  
CASE B: DL+LL ON AB; DL ON BC  
CASE C: DL ON AB; DL+LL ON BC

CASE A CONTROLS FOR  $M_{bmax}$   
CASE B CONTROLS FOR  $M_{amax}$ ,  $M_c$   
DESIGN MOMENTS ARE CIRCLED

BASED ON  $M_{bmax}$  USE  
 $b = 10"$   
 $h = 22"$   $d = 19.5"$

$A_s^-$  AT B: 3 No. 8 = 2.37 in<sup>2</sup>  
 $A_s^-$  AT A: 2 No. 7 = 1.20  
 $A_s^+$  AT AB: 3 No. 6 = 1.32

CUT OFFS ACCORDING  
TO FIG. 5.20a, BUT CARRY  
ALL  $A_s^+$  INTO SUPPORTS.

REDISTRIBUTION ALLOWED:

MIDSPAN :  $C = \frac{1}{0.85} \frac{1.32 \times 60}{0.85 \times 4 \times 10} = 2.74"$ ,  $E_t = \frac{0.003(19.5 - 2.74)}{2.74} = 0.0184$   
MAX = 18.4%

INT SUPT:  $C = \frac{1}{0.85} \frac{2.37 \times 60}{0.85 \times 4 \times 10} = 4.92"$ ,  $E_t = \frac{0.003(19.5 - 4.92)}{4.92} = 0.0089$   
MAX = 8.9%

TAKE MAX REDUCTION AT B: ADJ  $M_b^- = 156 \times 0.911 = 144 k$   
AND BY ADJUSTING  $M_a^-$  UPWARD KEEP  $M_{AB}^+$  AT 90 k

NOW REDUCE  $M_{AB}^+$  TO 90 k + ADJUST  $M_B^-$  UPWARD  
TO NEW  $M_B^- = 151 k$ ;  $M_A^-$  UNCHANGED; THIS GIVES  $M_{AB}^+ = 96 k$

12.4 (CON'T)

SO ADJUSTED DESIGN MOMENTS ARE:  
 $M_A^- = 79 \text{ k}$      $M_{AB}^+ = 90 \text{ k}$      $M_B^- = 144 \text{ k}$

$A_s^-$  AT B:    3 No. 7 = 1.80 in<sup>2</sup>  
 $A_s^-$  AT A:    2 No. 7 = 1.20 in<sup>2</sup>  
 $A_s^+$  AT AB:    2 No. 7 = 1.20 in<sup>2</sup>

AGAIN USE CUTOFF POINTS FROM  
FIG. 5.15a BUT CARRY ALL  $A_s^+$  INTO  
SUPPORTS

TOTAL WEIGHT OF STEEL WITHOUT ACI REDISTRIBUTION  
= 402 LB FOR 2 SPANS

TOTAL WEIGHT WITH REDISTRIBUTION = 356 LB

STEEL REDUCTION = 11.4%

12.5

Slab: span  $\approx 10'$

$$h_{min}(\text{Table 13.1}) = \frac{l}{24} = \frac{10 \times 12}{24} = 5"$$

$$w_s = 150 \times \frac{5}{12} = 62.5 \text{ lb/ft}^2$$

$$w_u = 1.2 \times 62.5 + 1.6 \times 150 = 315 \text{ lb/ft}$$

using ACI COEF (Table 12.1)

$$+ l_n = 9'$$

$$M_u = \frac{w_u l_n^2}{10} = \frac{0.315 \times 9^2}{10} = 2.55 \text{ ft-kips/ft}$$

From Table A.9 for  $d = 4"$  &  $\rho = 0.003$ ,

$$\phi M_n = 2.5 \text{ ft-kips/ft}, \rho = 0.0031$$

will work -

Beams + Girders: span  $\approx 30'$

Use same depth for both

Use  $3/4$  in./ft

$$h = \frac{3}{4} \times 30 = 22.5 \text{ in.}$$

$$h_{min} = l/18.5 = 30 \times 12/18.5 = 19.5 \text{ in.}$$

Beams: span =  $29' - 9" = 29.75'$

Try  $b = 12$  in,  $h = 24$  in,  $d = 21.5$  in.

$$w_d = 62.5 \times 10 + (24 - 5) \times 12 \times \frac{150}{144}$$

$$= 863 \text{ lb/ft} = 0.863 \text{ kips/ft}$$

$$w_l = 150 \times 10 = 1500 \text{ lb/ft} = 1.5 \text{ kips/ft}$$

$$w_u = 1.2 \times 0.863 + 1.6 \times 1.5 = 3.44 \text{ kips/ft}$$

$$M_u = \frac{w_u l_n^2}{10} = \frac{3.44 \times 29.75^2}{10} = 246 \text{ ft-kips}$$

Using Table A.5, for  $\rho = 0.012$ ,

$$R = 644$$

$$\phi M_n = R b d^2 = \frac{644 \times 12 \times 21.5^2}{12000}$$

$$= 298 \text{ ft-kips}$$

OKAY -

Girders: span =  $29.75'$

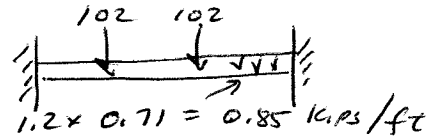

Beam loads on interior girders

$$= 29.75 \times 3.44 = 102 \text{ kips}$$

Assume  $b = 36$  in.

$$w_g = 36(24 - 5) \times \frac{150}{144} \times \frac{1}{1000} = 0.71 \text{ kips/ft}$$

Calculate  $F_{EM}$

$$1.2 \times 0.71 = 0.85 \text{ kips/ft}$$

$$F_{EM} = \frac{0.85 \times 29.75^2}{12} + \frac{2}{9} \times 102 \times 29.75$$

$$= 737 \text{ ft-kips}$$

$V$  @ 1st int support

$$= 1.15 \left( 102 + 0.85 \frac{29.75}{2} \right) = 132 \text{ kips}$$

$M_u$  @ exterior face of 1st

interior support =

$$\frac{12}{10} \times F_{EM} - \frac{V_u L}{2} \quad (\text{Assume } a = 1.5')$$

$$= 1.2 \times 737 - \frac{132 \times 1.5}{2} = 785 \text{ ft-kips}$$

$$\frac{M_u}{\phi b d^2} = \frac{785 \times 12000}{0.9 \times 36 \times 21.5^2} = 629$$

From Table A.5,  $\rho \approx 0.012$

For exterior girders, use

$$b = 24 \text{ in.}$$

$$w_g = 0.47 \text{ kips/ft}, 1.2 w_g = 0.56 \text{ kips/ft}$$

$$\text{Beam loads} = \frac{102}{2} = 56 \text{ kips}$$

$$F_{EM} = \frac{0.56 \times 29.75^2}{12} + \frac{2}{9} \times 56 \times 29.75$$

$$= 412 \text{ ft-kips}$$

$$V = 1.15 \left( 56 + 0.56 \times \frac{29.75}{2} \right) = 64 \text{ kips}$$

$$M_u = 1.2 \times 412 - \frac{64 \times 1.5}{2} = 446 \text{ ft-kips}$$

$$\frac{M_u}{\phi b d^2} = \frac{446 \times 12000}{0.9 \times 24 \times 21.5^2} = 536$$

$$\rho \approx 0.01 - \text{OK}$$

$\phi V_c = .85 \times 2 \sqrt{4000} \times 12 \times 7 \times \frac{1}{1000} = 9.03 \text{ k} > V_u \text{ OK}$   
 (No. 13)

$A_t$  IN DIRECTION  $\perp$  SPAN; USE No. 4 AT 13"  
 PLACE ON TOP OF BOTTOM FLEX STEEL.

13.3 COMPUTE  $\Delta_d$  FOR END SPAN (> INTERIOR!)  
 COMPUTE FOR LOADING CORRESPONDING TO  
 MAX  $M^+ = \frac{1}{14} w l_u^2$ . ASSUME BOTH END MOMENTS  
 ARE EQUAL; USE STATICALLY CONSISTENT VALUE:  
 DEAD LOAD = 100 + 10 + 10 = 120 PSF

$$\begin{aligned} \frac{1}{14} \times 120 \times 14.5^2 &= 1802 \text{ ft-lb} \\ \frac{1}{8} \times 120 \times 14.5^2 &= 3154 \text{ ft-lb} \\ 3154 - 1802 &= 1352 \text{ ft-lb} \end{aligned}$$

$$f_r = 7.5 \sqrt{f'_c} = 7.5 \sqrt{3000} = 411 \text{ psi}$$

$$I_g = \frac{1}{12} \times 12 \times 8^3 = 512 \text{ in}^4$$

$$M_{cr} = f_r \frac{I_g}{\delta t} = 411 \times \frac{512}{48} = 4384 \text{ ft-lb} > 1802 \text{ SO SLAB IS UNCRACKED AND}$$

NOW BY MOMENT-AREA:

$$I_e = I_g = 512 \text{ in}^4$$

$$\begin{aligned} EI &= 3.12 \times 10^6 \times 512 \\ &= 1597 \times 10^6 \text{ in}^2\text{-lb} \end{aligned}$$

$$\begin{aligned} \text{IMMEDIATE } \Delta_d &= \frac{1}{EI} \left( 3154 \times \frac{14.5}{2} \times \frac{2}{3} \times \frac{14.5}{2} \times \frac{5}{8} - 1352 \times \frac{14.5}{2} \times \frac{14.5}{4} \right) \\ &= \frac{33544 \times 1728}{1597 \times 10^6} = .036 \end{aligned}$$

$$\text{LONG TERM COMPONENT } \Delta_d = .036 \times 2 = .072$$

$$\text{NOW FOR DEAD + LIVE LOAD} = 120 + 125 = 245 \text{ psf!}$$

### 13.3 (CON'T)

$$\frac{1}{14} \times 245 \times 14.5^2 = 3679 \text{ ft-lb}$$

$$5 \frac{1}{8} \times 245 \times 14.5^2 = 6439 \text{ ft-lb}$$

$$6439 - 3679 = 2760 \text{ ft-lb}$$

AND  $3679 < M_{cr} = 4384 \text{ ft-lb}$  SO SLAB IS STILL UNCRACKED!

THEN  $\Delta_e = .036 \times \frac{125}{120} = \underline{\underline{.038"}}$

TIME VARIATION OF  $\lambda$ :

$\therefore$  PART OF TOTAL  $\Delta$  OCCURRING AFTER EQUIPMENT IS INSTALLED:

$$\Delta = \Delta_{d, \text{immed.}} \times 0.8 + \Delta_e = .036 \times 0.8 + .032 = .061"$$

ACI LIMIT VALUE (TABLE 6.3)  $= \frac{l}{480} = \frac{145 \times 12}{480} = .363" > .061"$   
SO SLAB IS OK

BUT NOTE THAT, BECAUSE  $\rho$  VALUES ARE VERY LOW FOR 8" SLAB, AND  $\Delta$  IS ONLY 17% OF ALLOWED VALUE, A BETTER DESIGN COULD USE A THINNER SLAB! ACI SPAN DEPTH LIMITS LED TO VERY CONSERVATIVE DESIGN HERE.

FINAL BARS & SPACING SET BY TEMP & SHRINKAGE

### Problem 13.8

$$V_u := 107 \text{ kip} \quad f_c := 3000 \text{ psi} \quad f_y := 60000 \text{ psi} \quad f_{ys} := 51000 \text{ psi}$$

$$t := 7.5 \text{ in} \quad d := 6 \text{ in} \quad t_{col} := 10 \text{ in} \quad \phi_s := 0.75 \quad \lambda := 1.0$$

From Example 13.7 the basic perimeter shear is inadequate and strengthening is required.

$$b_o := 4 \cdot (t_{col} + d) = 64 \text{ in}$$

a) Design truss bar solution

$$V_{max} := 6 \sqrt{f_c \cdot \text{psi}} \cdot b_o \cdot d = 126.2 \text{ kip} \quad \text{This is greater than } V_u \text{ so proceed.}$$

$$V_c := 2 \cdot \sqrt{f_c \cdot \text{psi}} \cdot b_o \cdot d = 42.1 \text{ kip} \quad \alpha := 45 \text{ deg}$$

$$A_v := \frac{V_u - V_c}{\phi_s \cdot f_y \cdot \sin(\alpha)} = 2.04 \text{ in}^2$$

Use four bars, two in each direction. this provides 8 bars crossing the critical section.

$$A_{bar} := \frac{A_v}{8} = 0.26 \text{ in}^2 \quad \text{Use 4-No.5 (No. 16) bars}$$

b) Design integral beam

The maximum allowable load by ACI 318 is  $V_{max} = 126.2 \text{ kip}$  per above.

Try No. 3 (No. 10) stirrups. With two stirrup legs per stirrup and four arms on the beams, the total area of shear reinforcement is:

$$A_{vo} := 4 \cdot 2 \cdot 0.11 \text{ in}^2 = 0.88 \text{ in}^2 \quad \text{and the spacing is} \quad s := \frac{\phi_s \cdot A_{vo} \cdot f_y \cdot d}{V_u - \phi_s \cdot V_c} = 3.15 \text{ in}$$

The Code requires a maximum spacing of  $d/2$ , therefore a spacing of  $s=3 \text{ in.}$  will be used.

The required perimeter is

$$b_{ol} := \frac{V_u}{\phi_s \cdot 2 \cdot \sqrt{f_c \cdot \text{psi}} \cdot d} = 217 \text{ in}$$

From the sketch below, it can be seen that the leg must extend 32 in from the column face and that 10 stirrups/leg are needed.

$$b_{\text{ofinal}} := 4 \cdot (32\text{in} \cdot \sqrt{2} + 10\text{in}) = 221\text{ in}$$

c) design headed shear studs

The minimum height of the headed shear studs is 5.68 in per example 13.6. Use 6 in.

Try  $s := 3\text{ in}$  since the stud spacing must be  $\leq d/2$

$$A_{vs} := \frac{(V_u - \phi_s \cdot V_c) \cdot s}{\phi_s \cdot f_{ys} \cdot d} = 0.986\text{ in}^2$$

Use two lines of studs per rail giving 8 studs crossing a critical plane. thus:

$$A_{\text{stud}} := \frac{A_{vs}}{8} = 0.123\text{ in}^2 \quad \text{No. 4 (No. 13) studs will be used. The layout is the same as for the integral beam and } 10 \times 2 \text{ studs will be used on each leg.}$$

Internal Beam solution

Headed stud solution

13.9  $h = 7.5 \text{ in}$   $d = 6 \text{ in}$  COLUMN =  $18 \times 18 \text{ in}$   
 $f'_c = 4000 \text{ psi}$   $V_u = 118,800 \text{ lb}$

ASSUME NEGATIVE REINFORCEMENT = No. 5 (No. 16) AT 5 in

$$\phi V_c = \phi 4 b_o d \sqrt{f'_c} = 0.75 (4) [4(18+6)] 6 \sqrt{4000} = 109,300 \text{ lb}$$

$$\phi V_c < V \therefore \text{USE SHEARHEAD}$$

$$\text{REQ'D } b_o = \frac{V_u}{\phi d 4 \sqrt{f'_c}} = \frac{118,800}{6 (0.75) 4 \sqrt{4000}} = 104.4 \text{ in}$$

$$b_o = 4 \sqrt{2} \left( \frac{c_1}{2} + \frac{3}{4} \left( l_v - \frac{c_1}{2} \right) \right) = 104.4$$

$$c_1 = 18 \text{ in}$$

$$l_v = 21.6 - \text{USE } 22 \text{ in}$$

TRY I SECTION  $54 \times 7.7$ ,  $f_y = 50 \text{ ksi}$   
 MOMENT RESISTANCE =  $176,000 \text{ in-lb}$   
 $E_s I_y = 174 \times 10^6 \text{ in}^2 \text{-lb}$

$$\#5 (\#16) \text{ AT } 5 \text{ in} \quad n A_s = 8 (0.74) \frac{24}{12} = 11.84 \text{ in}^2$$

LOCATE NEUTRAL AXIS

$$\bar{y} = \frac{11.84 (6) + 18.1 (2.75) + 12 \bar{y}^2}{11.84 + 18.1 + 24 \bar{y}}$$

$$\bar{y} = 2.16 \text{ in}$$

$$I_c = \frac{1}{3} 24 (2.16)^3 + 11.84 (3.84)^2 + 6 \times 8 + 18.1 (0.59)^2$$

$$= 309.5 \text{ in}^4$$

$$E_c I_c = 3.6 \times 10^6 (309.5) = 1114 \times 10^6 \text{ in}^2 \text{-lb}$$

$$\alpha_v = \frac{174}{1114} = 0.16 > 0.15 \text{ OK}$$

$$M_p = \frac{V_u}{2 \phi n} \left[ h_v + \alpha_v \left( l_v - \frac{c_1}{2} \right) \right] = \frac{118,800}{2 (0.75) 4} \left[ 4 + 0.16 \left( 22 - \frac{18}{2} \right) \right]$$

$$= 100,300 \text{ in-lb} < 176,000 \text{ CAPACITY (OK)} \quad \text{I BEAM IS ADEQUATE}$$

USING A COLUMN CAPITAL  $b_o = 104.4$ , SIDE =  $104.4/4 = 26.1 \text{ in}$   
 THE FOLLOWING CAPITAL CAN BE USED

$$b_o = 4 (18 + 4 + 4 + 6) = 128 \text{ in}$$

NOTE: AN EXTENSION AS SMALL AS 2" PROVIDES AN ACCEPTABLE  $b_o$ , BUT IS TOO SMALL TO FORM.

### 13.10 FLAT PLATE SHEAR.

#### AT COLUMN B-1

$$V_u = 105 \text{ kips}$$

$$M_{\text{UNBALANCED}} = 120 \text{ ft-kips}$$

$$M_{ub} = 0.60 \times M_u = 72.0 \text{ ft-kips}$$

$$M_{ur} = 0.40 \times M_u = 48.0 \text{ ft-kips}$$

$$A_c = 2 \times 6 [24 + 24] = 576 \text{ sq in.}$$

$$c_2 = c_r = 12 \text{ in.} \quad c_1 + d = 24 \text{ in.} = c_2 + d.$$

$$J_c = \frac{2 \times 6}{12} (24)^3 + \frac{2}{12} (24) 6^3 + 2 \times 6 (24) (12)^2$$

$$= 56160 \text{ in}^4$$

#### SHEAR STRESSES.

$$v_c = \frac{105000}{576} - \frac{48000 \times 12 \times 12}{56160} =$$

$$= 182 - 123 = 59 \text{ psi}$$

$$v_r = 182 + 123 = 305 \text{ psi}$$

$$v_{\text{allowed}} = 4 \times 0.85 \sqrt{4000} = 215 \text{ psi}$$

AND  $215 < 305$  SO NEED SOME EXTRA AGAINST SHEAR.

USE DROPPED PANEL AT EXTERIOR COLUMNS.

$$\text{TRY } h = 9\frac{1}{2} \text{ in.} \quad d = 8 \text{ in.}$$

$$c_1 + d = c_2 + d = 26 \text{ in.}$$

$$A_c = 2 \times 8 \times (26 + 26) = 832 \text{ sq in.}$$

$$c_2 = c_r = 13 \text{ in.}$$

$$J_c = \frac{2 \times 8}{12} (26)^3 + \frac{2}{12} (26) (8)^3 + 2 \times 8 (26) (13)^2$$

$$= 96000 \text{ in}^4$$

$$v_c = \frac{105000}{832} - \frac{48000 \times 12 \times 13}{96000}$$

$$= 126 - 78 = 48 \text{ psi}$$

$$v_r = 126 + 78 = 204 \text{ psi} < 215 \text{ psi}$$

OK!

### 13.11 FLAT PLATE DEFLECTIONS.

FLAT PLATE FLOOR OF EXAMPLE 9.4.

$$l_a = l_b = 22 \text{ FT} = 264 \text{ IN.} \quad E_c = 3.6 \times 10^6 \text{ psi}$$

$$h = 8\frac{1}{2} \text{ IN.}$$

#### IMMEDIATE DEFLECTION DUE TO TOTAL DEAD LOAD

$$I_{\text{FRAME}} = \frac{1}{12}(264)(8.5)^3$$

$$= 13510 \text{ IN}^4$$

$$I_{\text{COL}} = \frac{1}{12}(132)(8.5)^3$$

$$= 6755 \text{ IN}^4$$

$$I_{\text{MID}} = \frac{1}{12}(66)(8.5)^3$$

$$= 6755 \text{ IN}^4$$

SAME IN BOTH DIRECTIONS.

REFERENCE DEFLECTION: (D.L.  $\text{TOT} = 126.25 \text{ psf}$ )

$$d_{f, \text{ref}} = \frac{126.25 \times 22(22 \times 12)}{12 \times 384 \times 3.6 \times 10^6 \times 13510} = 0.0602 \text{ IN.}$$

AVERAGE OF THE LATERAL COEFFICIENTS FOR THE (+) AND (-) SECTIONS OF EACH STRIP.

$$\text{MIDDLE} \Rightarrow \frac{.25 + .40}{2} \approx 0.32 = \frac{M_{\text{MID}}}{M_{\text{FRAME}}}$$

$$\text{COLUMN} \Rightarrow \frac{.75 + .60}{2} \approx 0.68 = \frac{M_{\text{COL}}}{M_{\text{FRAME}}}$$

$$\text{THEN, } d_{f, \text{COL}} = 0.0602 \times 0.68 \times \frac{13510}{6755} = 0.0819 \text{ IN.}$$

$$d_{f, \text{MID}} = 0.0602 \times 0.32 \times 2.0 = 0.0385 \text{ IN.}$$

THUS, THE DIFFERENCE IN MOMENTS TO THE LEFT AND RIGHT OF THE COLUMN IS:

$$(365 - 333) \times \frac{126.25}{346.75} = 11.65 \text{ FT KIPS.}$$

THIS WAS DETERMINED FROM THE CASE OF ALL SPANS FULLY LOADED WITH TOTAL FACTORED LOAD  $\uparrow$  THEN MULTIPLIED BY  $\frac{D.L.}{F.L. \text{TOT}}$ .

$$\text{THIS, } \theta = \frac{11650 \times 12}{157.3 \times 3.6 \times 10^6} = 0.000247.$$

MIDSPAN

$$d_{o, \text{MID}} = \frac{0.000247 \times 22 \times 12}{8} = 0.0082 \text{ IN.} \uparrow$$

$$\text{THUS, } d_{\text{COL}} = 0.0819 - 0.0082(2) = 0.0655 \text{ IN.}$$

$$d_{\text{MID}} = 0.0385 - 0.0082(2) = 0.0221 \text{ IN.}$$

AND  $d_{\text{MAX}} = 0.0876 \text{ IN.} \downarrow$  = IMMEDIATE DEFLECTION DUE TO TOTAL DEAD LOAD.

#### TOTAL LONG-TERM DEFLECTION DUE TO DEAD LOAD

$$\text{USING } \lambda = 3.0, \delta_{\text{LONG}} = 3.0(0.0876) = 0.2628$$

$$\text{SO TOTAL } d = 0.350 \text{ IN.} \downarrow$$

#### IMMEDIATE DEF. DUE TO $\frac{3}{4}$ FULL LL.

THE WORST CASE OF LINE LOAD (BOTH FOR MOMENTS  $\uparrow$  DEF.) WILL OCCUR WHEN ONLY PANEL C IS LOADED W/  $\frac{3}{4}$  LL. BECAUSE THIS SYSTEM IS IDEALIZED AS LINEAR ELASTIC,

SUPERPOSITION MAY BE USED. THUS;

$$d_{f, \text{COL}} = 319 \times \left( \frac{126.25 + 75}{126.25} \right) = 0.1306 \text{ IN.}$$

$$d_{f, \text{MID}} = 0.0385 \times 1.594 = 0.0614 \text{ IN.}$$

$$M_{\text{NET}} = 24.5 \times (126.25 + 75) / 346.75 = 14.22 \text{ FT KIP}$$

$$\text{THUS, } \theta = \frac{14220 \times 12}{157.3 \times 3.6 \times 10^6} = 0.000301$$

$$d_{o, \text{COL}} = \frac{1}{8}(0.000301) \times 22 \times 12 = 0.0099 \text{ IN.} \downarrow$$

THUS,

$$d_{\text{COL}} = 0.1306 + 2(0.0099) = 0.1504 \text{ IN.}$$

$$d_{\text{MID}} = 0.0614 + 2(0.0099) = 0.0812 \text{ IN.}$$

$$d_{\text{DL}} + d_{\frac{3}{4} \text{ LL}} = 0.1504 + 0.0812 = 0.2316 \text{ IN.}$$

$$d_{\frac{3}{4} \text{ LL}} = 0.1504 - 0.0812 = 0.144 \text{ IN.}$$

TOTAL IMMEDIATE DEF. DUE TO  $\frac{3}{4}$  LL = 0.144 IN.

$$\text{TOTAL DEF.} \Rightarrow d_{\text{TOT}} = 0.35 + 0.144 = 0.494 \text{ IN.} \downarrow$$

14.1 WITH  $\phi m_{nx} = \phi m_{ny} = 700 \text{ FT-LB/FT}$  IN EACH DIRECTION SLAB IS ISOTROPIC AND  $\phi m_n = 7 \text{ FT-LB/FT}$  IN ANY DIRECTION.

FIRST MECHANISM:

BY VIRTUAL WORK, WITH SUCCESSIVE TRIALS FOR  $a$  EQUATE INTERNAL TO EXTERNAL WORK AND SELECT  $a$  TO GIVE MIN  $w$ :

$a$	$\theta_1$	$\theta_2$	$W_i$	$W_e$	$m$
3'	.389	.40	7.33 m	6.14 w	6.14 w
4	.320	.40	6.50 m	6.67 w	6.67 w
5	.283	.40	6.00 m	6.94 w	6.94 w
6	.260	.40	5.67 m	7.05 w	7.05 w
7	.246	.40	5.43 m	7.06 w	7.06 w
8	.236	.40	5.25 m	6.98 w	6.98 w
6.5	.252	.40	5.54 m	7.07 w	7.07 w *

\* GIVES LOWEST  $w$ .

SECOND MECHANISM:

AGAIN TAKE SUCCESSIVE  $a$  VALUES AND SELECT  $a$  TO GIVE MIN  $w$ :

# 14.1 (CON'T)

<u>a</u>	<u><math>W_i</math></u>	<u><math>W_e</math></u>	<u>m</u>
1	20.2 m	46.7 w	2.31 w
2	10.4 m	43.3 w	4.17 w
3	7.27 m	40.0 w	5.50 w
4	5.80 m	36.7 w	6.32 w
5 (MAX POSSIBLE)	5.00 m	33.3 w	6.67 w *

\* GIVES LOWEST w, BUT FIRST MECHANISM IS SEEN TO CONTROL, REQUIRING HIGHEST m FOR GIVEN w, HENCE LOWEST w FOR GIVEN m.

$$m = 7.07 w$$

$$7000 = 7.07 w$$

$$w = 990 \text{ PSF}$$

## 14.2 YIELD LINE ANALYSIS

VIRTUAL DISPLACEMENT FIELD  
ROTATION FOR POSITIVE MOMENT.

SMALL DISPLACEMENTS

$$\theta_2 \approx \tan \theta_2 = \frac{\delta}{BD} = \frac{\delta}{AD} \tan \alpha = \frac{\delta}{\sqrt{x^2 + y^2}} \frac{x}{y}$$

$$\theta_3 \approx \tan \theta_3 = \frac{\delta}{DC} = \frac{\delta}{AD} \tan \alpha = \frac{\delta}{\sqrt{x^2 + y^2}} \frac{y}{x}$$

$$\theta_1 = \theta_2 + \theta_3 = \left[ \frac{\delta}{\sqrt{x^2 + y^2}} \right] x \left( \frac{y}{x} + \frac{x}{y} \right)$$

ROTATION FOR NEGATIVE MOMENT.

INTERNAL VIRTUAL WORK

$$W_i = [M^+ \cdot AD \cdot \theta_1] + [M^- \cdot 10 \cdot \theta_2] + [M^- \cdot 20 \cdot \theta_3]$$

$$W_i = \left[ M^+ \sqrt{x^2 + y^2} \cdot \frac{\delta}{\sqrt{x^2 + y^2}} \left( \frac{y}{x} + \frac{x}{y} \right) \right] + M^- \left( 10 \frac{\delta}{x} + 20 \frac{\delta}{y} \right)$$

AND

$$M^+ = \phi M_n = 2.67 \text{ KIP FT} \approx \frac{8}{3} \text{ KIP FT.}$$

$$M^- = \phi M_n = 4.0 \text{ KIP FT.}$$

So,  $W_i = \frac{8}{3} \left( \frac{y}{x} + \frac{x}{y} \right) + \frac{40}{x} + \frac{80}{y}$   
WHERE  $y = (-x/2) + 10$ .

EXTERNAL VIRTUAL WORK

$$W_e = w_u \left[ \frac{10 \times 2}{2} \times \frac{1}{3} \right] + w_u \left[ \frac{20 \times 2}{2} \times \frac{1}{3} \right]$$

So,  $W_e = w_u \left[ \frac{5}{3} x + \frac{10}{3} y \right]$  WHERE  $y = -\frac{x}{2} + 10$ .

$$W_i = W_e$$

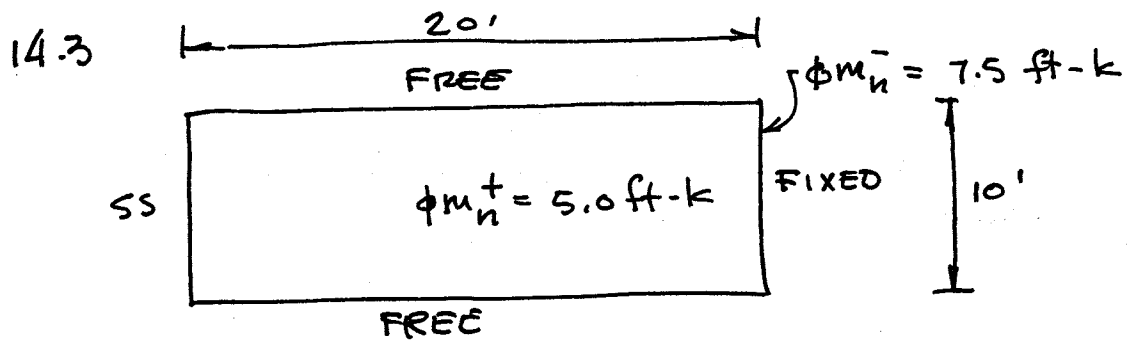

$$w_u = \left[ \frac{8}{3} x \left( \frac{y}{x} + \frac{x}{y} \right) + \frac{40}{x} + \frac{80}{y} \right] / \left[ \frac{5}{3} x + \frac{10}{3} y \right]$$

So,

X (FT)	Y (FT)	w <sub>u</sub> (KSF)
4.5	7.75	0.76
5.0	7.5	0.73
5.5	7.25	0.72
6.0	7.0	0.70
6.5	6.75	0.70
7.0	6.50	0.70
7.5	6.25	0.71
8.0	6.0	0.72
9.0	5.5	0.75

MINIMUM.

$$w_u = 0.70 \text{ KIPS / FT}^2$$

$$\sum M_A = 0 : w \left( \frac{20-x}{2} \right)^2 - 5.0 = 0$$

$$\sum M_C = 0 : \frac{wx^2}{2} - 5.0 - 7.5 = 0$$

SOLVE SIMULTANEOUSLY TO OBTAIN

$$x = 12.26'$$

$$w = .167 \text{ k/ft}$$

14.4

$$W_e = \frac{w \cdot k}{2} + \frac{w(20 - x)}{2} = 10w$$

$$W_i = 7.5 \times \frac{1}{x} + 5 \left( \frac{1}{x} + \frac{1}{20 - x} \right) = \frac{12.5}{x} + \frac{5}{20 - x}$$

$$W_e = W_i \quad \therefore \quad 10w = \frac{12.5}{x} + \frac{5}{20 - x}$$

SELECT SUCCESSIVE  $x$ :  
TO OBTAIN MIN  $w$

$x$	$w$
9	.184
10	.175
11	.169
12	.168
12.26	.167 *
13	.168
14	.173
15	.183

\* LOWEST  $w = .167 \text{ k/ft}$   
CORRESPONDING TO  $x = 12.26'$   
NOTE: CORRECT VALUE FOR PRACTICAL PURPOSES  
WOULD BE OBTAINED FOR  $x = 12'$  OR  $x = 13'$ ;  
VALUE OF  $x = 12.26'$  WAS OBTAINED FROM  
RESULTS OF PROBLEM 12.3

# 14.5 YIELD LINE ANALYSIS AND SLAB DESIGN

(VIRTUAL WORK)

DEFLECTED SHAPE ALONG DE

ROTATION ALONG AB

ROTATION ALONG BC

## INTERNAL VIRTUAL WORK

$$W_i = M \theta_1 + M \theta_2 + M \theta_3$$

WHERE M IS THE LINEAR RESISTING MOMENT ALONG THE YIELD LINES.

## EXTERNAL VIRTUAL WORK

$$W_e = w A_1 \delta_1 + w A_2 \delta_2$$

$$= w \left( \frac{1}{2} l_1 a \right) \left( \frac{1}{3} \right) + w \left( \frac{1}{2} l_2 d \right) \left( \frac{1}{3} \right)$$

$$= \frac{1}{6} w (l_1 a + l_2 d)$$

$$W_i = W_e$$

$$M = \frac{1}{6} w (l_1 a + l_2 d) / \left( \frac{1}{a} + \frac{1}{d} + \frac{1}{b} + \frac{1}{c} \right)$$

AND  $l_1 = 15$  FT,  $l_2 = 20$  FT. BY VARYING THE VALUES OF  $a, b, c, d, \frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d}$ . THE MAXIMUM VALUE OF M IS FOUND. THE RESPECTIVE NO'S: I.E. 5', 5.5', 27.35', 11.25', 12.2',  $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} + \frac{1}{d} = 6.72/w$ . max: 8.5', 12.1', 12.4', 8.7', 12.1',  $M = 8.32w$ .

A GOOD EST FOR DEPTH IS  $h = \frac{\text{PERIMETER}}{130} = 4"$ , BUT THIS WOULD NOT BE DEEP ENOUGH FOR TWO LAYERS OF STEEL + COVER SO USE 6".

LOADS - DL = 75 + 15 = 90 psf, LL = 40 psf.  
 $w = 1.4(90) + 1.7(40) = 194$  psf.  
 $M = 8.32(194) = 1.61$  KIP.FT/FT.

## REQUIRED REINFORCEMENT $d_{avg} = 4"$

$$A_{s, MIN} = 0.0018 \times 12 \times 6 = 0.130 \text{ IN}^2$$

$$p_{min} = 0.130 / 4 \times 12 = 0.0027.$$

TRY  $a = 0.29$ .

$$A_s = 1.61 \times 12 / 0.9 \times 60 \times (4 - 0.29) = 0.093 \text{ IN}^2$$

$$a = 0.093 \times 60 / 0.85 \times 4 \times 12 = 0.14 \text{ IN}.$$

FOR  $a = 0.14 \rightarrow A_s = 0.09 \text{ IN}^2$   $a = 0.13 \text{ IN}.$

BUT  $A_{s, MIN}$  APPLIES, SO; FOR M-REGIONS, PLACE STEEL  $\perp$  TO EDGE. USE 1-#3 PER FOOT OF SLAB ( $A_s = 0.11 \text{ IN}^2$ ) (CLOSE ENOUGH)

$$a = 0.14 \text{ IN. } M_u = 1.94 \text{ KIP.FT/FT.}$$

PLACE #3 BARS @ 12".

$l_d = 13$  INCHES. AND ESTIMATED INFLECTION POINT AT  $\frac{\text{SPAN}}{6} \Rightarrow$  ALONG AB =  $l_d = 55"$  ALONG BC =  $l_d = 42"$

FOR POSITIVE SECTIONS, PLACE AN ORTHOGONAL GRID AT BOTTOM OF SLAB  $\parallel$   $\perp$  TO FREE EDGE.

USE #3 @ 12".

$$\text{SHEAR: } V_u = 2 \times \sqrt{4000} \times (15 + 20) \times (12) \times 4 + 1000$$

$$= 180.6 \text{ KIPS.}$$

$$V_u = w A = 0.194 \times 150 = 29.1 \text{ KIPS}$$

$$\phi V_c = 180.6 / 29.1 = 6.2 \text{ OK.}$$

## 14.5 (CONT)

### DEFLECTION

FOR AN UPPER BOUND, CONSIDER A ONE FOOT STRIP ALONG FREE EDGE.

$$w = 90 \text{ psf} + 40 \text{ psf} = 130 \text{ psf.}$$

max  $\Delta$ .

$$\Delta = w \ell^4 / 384 EI ;$$

$$E = 57 \sqrt{f'_c} = 3600 \text{ ksi}$$

$$I = I_g = \frac{1}{12} (12)(6)^3 = 216 \text{ in}^4$$

$$M_{cr} = (7.5)(4000)(216)/3 = 2.84 \text{ k-ft}$$

$$m_a^+ = 0.130 (25)^3 / 24 = 3.285 \text{ k-ft.}$$

$$I_{cr} = 13.2 \text{ in}^4$$

$$I_{e_t} = 133.7 \text{ in}^4$$

$$m_a^- = 6.77 \text{ k-ft}$$

$$I_{e_t} @ A: I_{cr} = 7.40 \text{ in}^4$$

$$I_{e_A} = 22.9 \text{ in}^4$$

$$@ C: I_{cr} = 4.38 \text{ in}^4$$

$$I_{e_C} = 20.1 \text{ in}^4$$

$$I_e = \frac{1}{2} [(22.9 + 20.1)/2 + 133.7] = 77.6 \text{ in}^4$$

$$\Delta = \frac{0.130 \times 25^4 \times 12^3}{384 \times 3600 \times 77.6} = 0.817 \text{ in. OK.}$$

THIS IS A HIGH UPPER BOUND  $\frac{1}{2} \ell$  IT DOES NOT TAKE INTO ACCOUNT THE CONTINUITY OF THE SLAB ALONG THE INSIDE EDGE OF THE STRIP CONSIDERED. CONTINUITY WILL BOTH RESTRAIN THE DEFLECTION AND INCREASE THE STIFFNESS.

## 14.6 YIELD LINE SLAB ANALYSIS

### INTERNAL WORK

$$M_+ (\overline{AM} \Theta_{AM} + 2 \overline{MN} \Theta_{MN}) + M_- (2 \overline{BA} \Theta_{BA} + 2 \overline{PR} \Theta_{PR}^*)$$

$$6.5 (18.6 \times 0.115 + 2 \times 8.4 \times 0.235) + 8.9 (20 \times 0.077 \times 2 + 2 \times 3.54 \times 0.061)$$

$$= 70.80$$

### EXTERNAL WORK

$$2w \left[ \left( \frac{1}{2} \times 13 \times 20 \times 0.33 \right) + \left( \frac{1}{2} \times 8.4 \times 7.0 \times 0.41 \right) \right] + 2 \times 0.33 \times w \times \left( \frac{1}{2} \times 3.54 \times 5.44 + \frac{1}{2} \times 6.49 \times 5.33 \right)$$

$$= 129.44 w$$

AND EQUATING THE TWO  $\Rightarrow 70.80 = 129.44 w$ ,  $w = 0.547 \text{ pf}$ .

THIS PROCEDURE IS REPEATED A NUMBER OF TIMES, USUALLY AT LEAST THREE, UNTILL THE MIN.  $w$  IS FOUND. EACH TIME, THE GEOMETRY IS CHANGED A SMALL AMOUNT, i.e.  $y' = 13.5'$  INSTEAD OF  $13.0'$ .

\* CALCULATION IMPLIES A NEG. Y.L. ALONG  $RR'$ . THIS IS UNLIKELY! ROTATION ABOUT  $RR'$  WOULD LIKELY OCCUR, AS PIPE COLUMN PROVIDES LITTLE ROTATIONAL RESTRAINT AT JOINT. BOTH INTERNAL AND EXTERNAL WORK EXPRESSIONS WOULD CHANGE. THE POSSIBILITY OF A HINGE ALONG  $RR'$  SHOULD BE INVESTIGATED - THIS CASE STATICALLY DETERMINATE!

$$\sqrt{\frac{144^2}{484}} = 4.2 \text{ TOO HIGH.}$$

$$\text{USE } 2 \times .45 \times 0.85 \times 3000 = 3315$$

$$3315 > 2940 \text{ REQD. } \therefore \text{OK}$$

## PROBLEM 16.3

$$f'_c := 3000 \text{ psi}$$

$$f_y := 60000 \text{ psi}$$

$$q_{all} := 3000 \text{ psf}$$

$$w_c := 150 \cdot \frac{\text{lb}}{\text{ft}^3}$$

$$P_d := 135 \cdot \text{kip}$$

$$P_l := 125 \cdot \text{kip}$$

$$\phi_s := 0.75$$

$$\phi_f := 0.90$$

$$\phi_b := 0.65$$

column  $f'_c = 4000 \text{ psi}$

$$t := 11 \cdot \text{in}$$

## METHODOLOGY

1. Check soil bearing capacity including adjustment for footing weight.
2. Check punching shear. This check often sets the thickness of the footing.
3. Check slab shear.
4. Design flexural reinforcement.
5. Check bond and development length.
6. Check bearing stress under the column, especially if the column concrete strength is greater than the footing concrete strength.
7. Check temperature and minimum steel requirements and sketch final design.

## Step 1 Check soil bearing

$$P := P_d + P_l = 260 \text{ kip}$$

$$b_{\text{trial}} := \sqrt{\frac{P}{q_{all}}} \quad b_{\text{trial}} = 9.309 \text{ ft}$$

This dimension does not account for the weight of the spread footing, therefore try

$$b := 10 \cdot \text{ft}$$

$$h := 27 \text{ in}$$

Trial thickness for weight purposes

In addition, the development length of a No. 9 (No. 29) bar in compression is 19 in. when confined in 300 psi concrete. This depth assures dowel development

Estimate footing weight Note; this could have been done before checking the footing size. It is separated here to illustrate the use of the weight for the footing size and the non-use of the weight for strength design.

$$W := w_c \cdot b^2 \cdot h = 33.75 \text{ kip}$$

$$q := \frac{P + W}{b^2}$$

$$q = 2938 \frac{\text{lb}}{\text{ft}^2}$$

$q$  is equal to the 3000 psf allowable, therefore proceed with the design using a 10 ft. square footing.

Develop the factored loads for the footing design.

$$P_u := 1.2 P_d + 1.6 P_l = 362 \text{ kip}$$

Note, the weight of the footing is ignored because the concrete rests directly on the soil so there is not net shear or bending moment.

$$q_u := \frac{P_u}{b^2} = 3.62 \text{ ksf}$$

### Step 2 Check Punching (two-way) Shear

$$\text{Try } d := h - 4 \cdot \text{in} \quad d = 23 \text{ in}$$

4" difference between h and d reflects 3" cover and 1 to center of bars in two layers. H is less than the 36" originally used for weight so the bearing stress is OK.

$$b_o := 4 \cdot (d + t) = 136 \text{ in} \quad v_c := 4 \sqrt{f'_c \cdot \text{psi}} = 219 \text{ psi}$$

$$A_v := b_o \cdot d = 3128 \text{ in}^2$$

$$\phi V_n := \phi_s \cdot v_c \cdot A_v = 514 \text{ kip}$$

$$\phi V_n > V_u = P_u = 362 \text{ kip, therefore the design is OK.}$$

### Step 3 Check One-Way Shear along the face of the footing

$$w := \frac{b}{2} - d - \frac{t}{2} = 2.625 \text{ ft} \quad V_u := q_u \cdot w \cdot b = 95 \text{ kip}$$

$$\phi V_c := 2 \phi_s \cdot \sqrt{f'_c \cdot \text{psi}} \cdot b \cdot d = 227 \text{ kip}$$

Nominal shear capacity exceeds the ultimate load, therefore, one way shear is OK

### Step 4 Flexural Design

While the shear may be computed at a location d from the face of the column, the flexural design must be computed at the face of the column.

$$l := \frac{b}{2} - \frac{t}{2} = 4.54 \text{ ft} \quad M_u := \frac{q_u \cdot l^2}{2} = 448 \frac{1}{\text{ft}} \text{ in} \cdot \text{kip}$$

$$\text{try } a := 2 \cdot \text{in}$$

$$A_s := \frac{M_u}{\phi_f f_y \left( d - \frac{a}{2} \right)} = 0.377 \frac{\text{in}^2}{\text{ft}} \quad A_{s6} := 0.44 \text{ in}^2$$

$$t + d/2 + d/2$$

$$s := \frac{A_{s6}}{A_s} \cdot 12 \cdot \frac{\text{in}}{\text{ft}} \quad s = 14.0 \text{ in}$$

Try #6 @ 14 in.  $A_s$  provided = 0.33 in<sup>2</sup>/ft

Check "a"

$$\frac{0.33 \cdot \text{in}^2 \cdot f_y}{.85 \cdot f_c' \cdot 12 \cdot \text{in}} = 0.65 \text{ in} < a \text{ assumed, OK}$$

The estimate for "a" could be refined, but as will be seen later, the refinement is not necessary at this time.

### Step 5 Check Bond and Development

The development length must be less than the portion of the slab extending beyond the face of the column.

#6 bottom bar from table A.10,  $l_d/d_b = 38$

$$d_b := 0.75 \cdot \text{in} \quad c := 3 \cdot \text{in}$$

$$l_d := 38 \cdot d_b \quad l_d = 28.5 \text{ in} < \frac{b}{2} - \frac{t}{2} - c = 51.5 \text{ in}$$

Therefore the development length is OK

### Step 6 Check Column Bearing Stress on Footing

Column and footing do not have the same strength, therefore an additional check is needed.

The building code allows for the effective bearing area in the footing to be increased assuming a 2:1 spread in load, however, the maximum ratio of increase is limited to 2. ACI 2008 Section 10.14. Try basic column area first.

$$f_{ball} := 0.85 \cdot f_c' \cdot \phi_b \quad f_{ball} = 1658 \text{ psi}$$

Using the increased allowable area for bearing

$$f_b := \frac{P_u}{2t^2} = 1496 \text{ psi} \quad \text{Bearing stresses are OK.}$$

### Step 7 Check temperature and minimum reinforcement

$$A_{st} := 0.0018 \cdot h \quad A_{st} = 0.583 \frac{1}{\text{ft}} \text{ in}^2$$

Temperature reinforcement is less than provided, therefore OK

Minimum reinforcement is greater than provided. Increase reinforcement to #6 @ 9 in.

$$A_s := 0.44 \text{ in}^2 \cdot \frac{12 \text{ in}}{9 \text{ in}} = 0.587 \text{ in}^2$$

**Final Detailing**

## 16.4 FOOTING DESIGN

$$P_0 = 1.2D + 1.6L = 1.2(500) + 1.6(514) = 1422 \text{ KIPS}$$

LONG SIDE = 2 x SHORT SIDE.

ASSUME AVG UNIT WEIGHT = 125 PCF

$$Q_{EFF} = 8000 - (6 \times 125) = 7250 \text{ PSF}$$

$$A_{REQD} = \frac{2 \times 500 + 2 \times 514}{7.25} = 280 \text{ SQ FT}$$

X = SHORT DIRECTION.

$$X(2X) = 2X^2 = 280. \quad X = 11.8 \text{ FT.}$$

FOOTING IS 12 FT x 24 FT.

$$Q_u = \frac{1}{288} \times [1.2 \times 1000 + 1.6 \times 1028] \\ = 9.88 \text{ KSF.}$$

### DESIGN OF LONGITUDINAL STEEL

TRY  $d = 36 \text{ IN.}$

$$V_u = 781 - \left(\frac{36}{12} \times 118.6\right) = 425 \text{ KIPS}$$

$$V_d = .75 \times 2 \times \sqrt{3000} \times 144 \times 36 = 426 \text{ KIPS.}$$

SO,  $426 > 425$  OK!

### CHECK PUNCHING SHEAR

$$V_u = \text{COL. LOAD} - \text{SOIL PRESS. W/IN. PERIM.}$$

$$= 1422 - \frac{(22 \times 36)^2}{12 \times 12} \times 9.88 = 1191 \text{ K.}$$

$$V_d = .75 \times 4 \times \sqrt{3000} \times 232 \times 36 = 1372 \text{ K. OK.}$$

$$\text{TOTAL FOOTING THICKNESS: } 36 + 3\frac{1}{2} = 40 \text{ IN.}$$

### STEEL FOR NEG. MOMENT REGION

$$M_u / \phi b d^2 = 25,700 / 1.9 \times 144 \times 36^2 = 153 \quad \rho < \rho_{min}$$

$$\rho_{min} = 0.0033.$$

$$A_{REQD} = 0.003 \times 144 \times 36 = 17.26 \text{ IN}^2.$$

$$\text{USE } \#11 @ 12 \text{ IN. } A_s = 17.19 \text{ IN}^2.$$

$$d_4 = \frac{1}{54.77} \times 0.04 \times 1.4 \times 1.56 \times 60000 = 96 < 141 \text{ IN. OK.}$$

### USE SAME STEEL IN POS. MOM. REGION

$$\#11 @ 12 \text{ IN.}$$

$$d_4 = \frac{1}{54.77} \times 0.04 \times 1.56 \times 60000 = 69 > 43,$$

SO MUST USE HOOK AT END.

### DESIGN OF TRANSVERSE STEEL (UNDERLINGS)

$$\text{EFF. WIDTH OF TRANS. BEAM} = 22 + d = 58 \text{ IN.}$$

$$\text{NET UPWARD LOAD} = 1422 / 12 \text{ FT} = 118.6 \text{ K/FT.}$$

$$M @ \text{COL. FACE} = 118.6 \left( \frac{5.08^2}{2} \right) = 1530 \text{ K FT.}$$

$$d = 36 - 1\frac{1}{2} = 34\frac{1}{2} \text{ IN.}$$

$$M_u / \phi b d^2 = 295 \quad \rho = 0.0052$$

$$A_{REQD} = 0.0052 \times 58 \times 34.5 = 10.4 \text{ IN}^2.$$

$$\text{USE } 7 - \#11 @ 8 \text{ IN. } A_s = 10.9 \text{ IN}^2$$

$$d_4 = 69 \text{ IN (AS BEFORE)}$$

$$\text{AVAIL. LENGTH} = 5.08 \times 12 = 58 \text{ IN} < 69$$

SO HOOK BOTH ENDS.

### CHECK BEARING OF COLUMN ON FOOTING

$$V_d = 2 \times .85 \times 3000 \times 22^2 \times .65 = 1604 \text{ KIPS}$$

$$V_u = 1.2 \times 500 + 1.6 \times 514 = 1422 < 1604 \text{ OK.}$$

$$A_{min} = 0.005 \times 22^2 = 2.42 \text{ IN}^2$$

USE 4 - #11 GO ALL SAME DIAM. BARS.

$$d_{col} = 30 \text{ IN} \quad d_{ftg} = 34 \text{ IN.}$$

- BEND BOTTOMS FOR CONSTRUCTION.

16.5  $f'_c = 4000 \text{ psi}$ , for column  
 $f'_c = 3000 \text{ psi}$ , for footing  
 $f_y = 60,000 \text{ psi}$

$$P_U = 1.2(285) + 1.6(570) = 1248 \text{ K}$$

$$P_{U, \text{pile}} = P_U / 9 = 1248 / 9 = 139 \text{ K}$$

Design depth for shear across length of footing

$$V_u = 3P_{U, \text{pile}} = 3(139) = 417 \text{ K}$$

$$\phi V_c = \phi 2\sqrt{f'_c} b d \geq V_u$$

$$d = \frac{V_u}{\phi 2\sqrt{f'_c} b} = \frac{417}{0.75(2)\sqrt{3000} \cdot 9 \times 12}$$

$$d = 47.0 \text{ in}$$

$$\text{Use } d = 48.0 \text{ in, } h = 48 + 9 + 1 = 58 \text{ in}$$

Check Punching shear

$$V_U = P_U = 1248 \text{ K}$$

$$\phi V_c = \phi 4\sqrt{f'_c} b_o d$$

$$b_o = 4(d + 19) = 4(48 + 19) = 268 \text{ in}$$

$$\phi V_c = 0.75(4) \frac{\sqrt{3000}}{1000} 268(48)$$

$$\phi V_c = 2114 \text{ K} > V_u \text{ OK}$$

Check Pile punching: There will BE AN OVERLAPPING OF ALL EIGHT EXTERIOR SHEAR PARAMETERS. THE SHEAR ENVELOPE ALMOST COINCIDES WITH THE COLUMN PERIMETER. THUS, NO NEED TO CHECK AS LOADS WILL BE DIRECTLY TRANSFERRED.

DESIGN FLEXURAL REINFORCEMENT

M AT COLUMN FACE

$$M_U = 3(139) \left( 3 - \frac{19}{12} \right) = 921 \text{ FT-KIP}$$

# 17.1 (CON'T.) FINAL DESIGN

NOTE: THE ORIGINAL BAR SELECTION USED No. 8 (No. 25) BARS, BUT WAS REDUCED TO No. 7 (No. 22) TO MEET BOND REQUIREMENTS AND AVOID HOOKS ON HEEL AND TOE. THE ECONOMICS OF STRAIGHT BARS OUTWEIGHS THE PLACEMENT COSTS OF FEWER No. 8 (No. 25) HOOKED BARS. IN EITHER CASE A HOOK IS NEEDED FOR THE ARM/ROOTING JOINT

17.2 STABILITY INVESTIGATION OF COUNTERFORT WALL IS THE SAME AS FOR THE CANTILEVER WALL EXCEPT FOR THE WEIGHTS.

DESIGN OF VERTICAL WALL AND HEEL IS BEST DONE WITH HILLERBORG STRIP METHOD. ONE LAYOUT IS SHOWN. THE TOE IS DESIGNED AS A SIMPLE CANTILEVER AS IN PROB. 17.1. THE BUTTRESS FOR THE COUNTERFORT CAN BE DESIGNED AS A STRUT AND TIE MODEL.

USING THE COUNTERFORT DESIGN WILL INCREASE THE FORMING COSTS AND DECREASE CONCRETE AND STEEL COSTS. SAVINGS OF 15-20% COMPARED TO THE CANTILEVER.

STRIPS FOR HILLERBORG METHOD - WALL

STRIPS FOR HILLERBORG METHOD - Heel

$$(1.2 \times 2 + 1.0 \times 0.93) 25 / 2 = 42 \text{ K}$$

$$V_e = \frac{1223 + 1012}{25} + 4 = 89 + 42 = 131 \text{ K}$$

SINCE  $89 > \frac{1}{2} \times 131$ , STIRRUPS MUST RESIST  $V_e$  OVER  $2h = 2 \times 36 = 72''$  FROM THE FACE OF BOTH COLUMNS.

FIRST HOOP IS PLACED 2" FROM COL. FACE.

MAXIMUM SPACING  $S = \min \left[ \frac{d}{4} = 33.4 / 4 = 8.35'' \right]$ , 8db FOR SMALLEST LONGITUDINAL BAR  $= 8 \times 1.128 = 9.02''$ , OR 24db FOR HOOP BARS (No. 3)  $= 24 \times 3/8 = 9'' = 8''$

$$A_v = \frac{V_s s}{f_y h d} = \frac{(V_e / \phi) s}{f_y h d}$$

$$= \frac{(130 / 0.75) 8}{60 \times 33.4} = 0.69 \text{ in}^2$$

USE No. 4 bars FOR DOUBLE HOOPS AS SHOWN

$$A_v = 0.80 \text{ in}^2$$

$$89 + 42 = 131 \text{ K}$$

$$89 - 42 = 47 \text{ K}$$

72" (= 6') FROM FACE OF COLUMN:  $V_e = 111 \text{ K}$

$$V_c = 2 \sqrt{4000} \times 27 \times 33.4 / 1000 = 114 \text{ K}$$

SPACING CAN INCREASE TO  $d/2 = 16.7'' < 24''$  USE 16"

$$A_v = \frac{\left( \frac{111}{0.75} - 114 \right) 16}{60 \times 33.4} = 0.27 \text{ in}^2$$

$$A_{vmin} = \frac{50 b_w s}{f_y} = \frac{50 \times 27 \times 16}{60,000} = 0.36 \text{ in}^2$$

USE SINGLE No. 4 STIRRUPS ( $A_v = 0.40 \text{ in}^2$ ) AT 16"

STIRRUPS MUST HAVE SEISMIC HOOKS AT BOTH ENDS -

USE 1 @ 2" FROM FACE OF SPT,  
9 @ 8",  
+ 15 @ 16" TO MIDSPAN -

20.5  
(a)

Satisfactory to check  
bending in plane of girder  
since this will control -  
 $b_{eff}(\text{girder}) = 20 + 2 \times 32 = 84 \text{ in.}$   
 $M_{nb}^- : 4 \text{ No. } 10, A_s = 5.08 \text{ in}^2$   
 $A_s f_y = 5.08 \times 60 = 304.8 \text{ Kips}$   
 $d = 28 - 2 - 1.27/2 = 25.37 \text{ in.}$   
 $a = 304.8 / (0.85 \times 4 \times 20) = 4.48 \text{ in.}$   
 $M_{nb}^- = A_s f_y (d - \frac{a}{2}) = \frac{304.8}{12} (25.37 - \frac{4.48}{2})$   
 $= 587.5 \text{ ft-kips}$

$M_{nb}^+ : 4 \text{ No. } 9, A_s = 4 \text{ in}^2$   
 $A_s f_y = 240 \text{ Kips}$   
 $d = 28 - 2 - 1.128/2 = 25.44 \text{ in.}$   
 $a = 240 / (0.85 \times 4 \times 84) = 0.84 \text{ in.}$   
 $M_{nb}^+ = \frac{240}{12} (25.44 - \frac{0.84}{2}) = 500 \text{ ft-kips}$

Columns:

$$\text{Upper Col} - K_n = \frac{P_u}{f_c A_g} = \frac{1100}{4 \times 676} = 0.406$$

$$\text{Lower Col} - K_n = \frac{1232}{4 \times 676} = 0.455$$

Reinf = 8 No. 14 bars,  $A_{st} = 18 \text{ in}^2$

$$e_g = 0.0266$$

Cover to center of  
bar =  $2 + 1.693/2 = 2.85 \text{ in.}$

$$\gamma = \frac{26 - 2 \times 2.85}{26} = 0.78$$

Use Graphs A.6 + A.7

$$(\gamma = 0.70 + 0.80)$$

Upper col A.7 A.6

$$R_n = \frac{M_{nc}}{f_c A_g h} = 0.8(0.212) + 0.2(0.95)$$

$$= 0.209$$

$$M_{nc} = 0.209 \times 4 \times 676 \times 26/12 = 1224 \text{ ft-kips}$$

Lower col A.7 A.6

$$R_n = 0.8(0.207) + 0.2(0.187)$$

$$= 0.203$$

$$M_{nc} = 0.203 \times 4 \times 676 \times 26/12 = 1189 \text{ ft-kips}$$

By inspection  $\sum M_{nc} > \frac{6}{5} \sum M_{nb}$

Minimum transverse reinf.  
in col. adjacent to joint -

$$l_o = \max [h = 26 \text{ in.}, \frac{1}{6} \text{ clear span} = (12 \times 12 - 28)/6 = 19.3 \text{ in.}, 18 \text{ in.}]$$

$$= 26 \text{ in.}$$

No. 4 hoops

$$h_{x \max} = 13 - 2.85 + 1.693 \times 0.5 = 12.34 \text{ in.}$$

Max spacing of transverse  
reinf. in columns =

$$S = \min (\frac{4}{3} = 6.5, 6d_b = 10.2, S_o)$$

$$S_o = 4 - \frac{14 - h_x}{3} = 4 - \frac{14 - 12.34}{3} = 4.55 \text{ in.}$$

Use  $S = 4 \text{ in.}$

For No. 4 bars,

$$h_c = 26 - 2 \times 1.5 = 23 \text{ in.}$$

$$A_{ch} = 23^2 = 529 \text{ in}^2$$

20.5 Continued

$$A_{sh} \geq 0.3 \frac{s_b c f_c}{f_y t} \left( \frac{A_g}{A_{ch}} - 1 \right)$$

$$= 0.3 \frac{4 \times 23 \times 4}{60} \left( \frac{676}{529} - 1 \right) = 0.51 \text{ in.}^2$$

$$\geq 0.09 \frac{s_b c f_c}{f_y t} = 0.09 \frac{4 \times 23 \times 4}{60} = 0.54 \text{ in.}^2$$

$$3 \text{ No. 4 legs} = 0.6 \text{ in.}^2 \quad \text{OK}$$

(b)  $M_{pr}$  based on  $1.25 f_y$

$$\text{Clear span} = 24 - 26/12 = 21.83 \text{ ft}$$

$$\text{Negative bending} - A_s = 5.08 \text{ in.}^2$$

$$a = 1.25 \times 5.08 \times 60 / (0.85 \times 4 \times 20) = 5.6 \text{ in.}$$

$$d = 25.37 \text{ (part a)}$$

$$M_{pr1} = \frac{1.25 \times 5.08 \times 60 \left( 25.37 - \frac{5.6}{2} \right)}{12}$$

$$= 717 \text{ ft-kips}$$

$$\text{Positive bending} - A_s = 4.00 \text{ in.}^2$$

$$a = 1.25 \times 4 \times 60 / (0.85 \times 4 \times 84) = 1.05 \text{ in.}$$

$$M_{pr2} = \frac{1.25 \times 4 \times 60 \left( 25.44 - \frac{1.05}{2} \right)}{12} = 623 \text{ ft-kips}$$

$$\frac{W_{pln}}{Z} = (1.2 \times 2.8 + 1.0 \times 1.3) 21.83/2 = 50.9$$

$$V_e = \left( \frac{717 + 623}{21.83} \right) + 50.9 = 112 \text{ KIPS}$$

Since  $61.4 > \frac{1}{2} 112$ , stirrup must resist  $V_e$  over  $2h = 2 \times 28 = 56 \text{ in.}$

from the face of both columns

First hoop is placed 2 in. from cal. face

$$\text{Max spacing } S = \min \left[ \frac{d}{4} = \frac{25.4}{4} = 6.35 \text{ in.} \right]$$

8  $d_b$  for smallest longitudinal bar

$$= 8 \times 1.128 = 9.02 \text{ in.}, 24 d_b \text{ for hoop bars}$$

$$(\text{No. 3}) = 24 \times \frac{3}{8} = 9" = 6 \text{ in.}$$

$$A_v = \frac{V_{ss}}{f_y t d} = \frac{(V_e / \phi) s}{f_y t d} = \frac{(112 / 0.75) 6}{60 \times 25.4}$$

$$= 0.59 \text{ in.}^2$$

Use No. 4 bars for double hoops

$$A_v = 0.80 \text{ in.}^2$$

$$61 + 51 = 112 \text{ KIPS}$$

56 in (4'-8") from cal. face,

$$V_e = 112 - 4 \frac{2}{3} \times 4.36 \text{ KIPS/ft} = 92 \text{ KIPS}$$

$$V_c = \frac{2 \sqrt{4000} \times 20 \times 25.4}{1000} = 64 \text{ KIPS}$$

spacing can increase

$$\text{to } \frac{d}{2} = 12.7" < 24", \text{ use } 12 \text{ in.}$$

$$A_v = \frac{\left( \frac{92}{0.75} - 64 \right) \times 12}{60 \times 25.4} = 0.46 \text{ in.}^2$$

$$A_{vmin} = \frac{50 S_w S}{f_y t} = \frac{50 \times 20 \times 12}{60 \times 25.4} = 0.20$$

Drop spacing to 10 in.,

$A_v$  becomes  $0.38 \text{ in.}^2$  + use

a single No. 4 stirrup

$$A_v = 0.40 \text{ in.}^2$$

stirrups must have seismic hooks @ both ends

Use 1 double hoop 2 in. from face of support,

9 double hoops @ 6 in

7 single stirrups @ 10 in.

leaves 5 in. space from span & + 10 in. space from hoop on other side of &
